FOREWORD

It is with great pleasure to present the results of the Federated States of Micronesia (FSM) 2016 Integrated Agriculture Census (IAC). This nation-wide census of agriculture was a large-scale undertaking jointly facilitated by the FSM Department of Resources and Development along with the Chuuk, Kosrae, Pohnpei and Yap State Agriculture, Forestry and Fisheries Agencies. This major accomplishment is the first of its kind after FSM became a sovereign nation.

The adoption of the nation's Agriculture Sector Policy (2012-2016) recognizes the critical importance of the agriculture sector to the FSM economy and the central role it can play in achieving sustained economic growth, trade development and poverty reduction, hence the emphasis for an agriculture census output.

The 2016 IAC Report therefore provides a wealth of information that can be used in formulating sound policies and strategic actions in the development of this key sector. I am confident that the comprehensive data on various aspects of agriculture provided in this report will be of great value to those concerned in developing this recognized priority sector of the economy. This report complements findings of the 2013/14 Household Income and Expenditure Survey, allowing for trend analysis.

The project was made feasible through funding and technical assistance from the FSM National Government and its Development Partners. We especially extend our sincere thanks to Government of India, the United Nations Food and Agriculture Organization (FAO), and The Pacific Community (SPC).

Special appreciation is also extended to the FSM households who responded to the Agriculture Census; the successful completion of the census would not have been possible without their cooperation. Furthermore, I would like to recognize the state governments and community representatives for their support and guidance, as well as the project team at this Department.

I urge all users to fully utilize the survey results to guide your planning of relevant projects and programs.

Hubert K. Yamada V

Acting Secretary, Department of Resources & Development Federated States of Micronesia National Government

od few se

ACKNOWLEDGEMENTS

The FSM Department of Resources and Development is indebted to the efforts of all those who contributed to the development of the nation's first ever Integrated Agriculture Census.

Special thanks and sincere gratitude is extended to the Executive, Legislative and Judiciary branches of the FSM National and State Governments, as well as the India Government for providing the funds for moving this national endeavor forward. Special recognition is extended to the United Nations Food and Agriculture Organization (FAO) and The Pacific Community for their unwavering funding and technical support throughout this major undertaking.

Special recognition is also extended to all the community leaders, representatives, as well as farmers and fisher folks who had taken their time to help our staff and respond to the enumerators during the life span of the agriculture census data collection exercises.

We would like to also commend all the dedicated statistics staff of the Department as well as the overseas technical staff without which the development of this report would have been possible. Last but not the least, we would also like to acknowledge FAO for reviewing of the report.

Marlyter Silbanuz

Acting Assistant Secretary, Divison of Agriculture Department of Resources and Development

Source: FSM Integrated Agriculture Census 2016

This report is the first output from the Federated States of Micronesia (FSM) 2016 Integrated Agriculture Census (IAC).

There has been no national census of agriculture carried out in FSM³. Prior to this census limited accurate, consistent and timely agricultural data has been available. This has meant the Government has had difficulty in designing appropriate policies and making meaningful plans for the sector.

This report aims to provide information for public, private and international sector decision makers and planners on the basic structure of the primary production sectors and to provide some benchmarks for sustainable planning and development programs.

The census collected a wide range of data, not all of which has been able to be analyzed for this report. Some additional tables are available on request, and it is hoped that the data will be able to be made available to researchers on request to FSM.

³ The FSM states were included in a 1969 Agriculture census carried out by the United State department of Agriculture when FSM was part of the Trust Territory of the Pacific Islands, a United Nations Trust Territory under U.S. administration.

1.1 The Federated States of Micronesia

The Federated States of Micronesia (FSM) is an independent sovereign island nation consisting of four states – from west to east, Yap, Chuuk, Pohnpei and Kosrae – that are spread across the western Pacific Ocean. Together, the states comprise around 607 islands (a combined land area of approximately 702 km²) that cover a longitudinal distance of almost 2,700 km just north of the equator. They lie northeast of New Guinea, south of Guam and the Marianas, west of Nauru and the Marshall Islands, east of Palau and the Philippines.

While FSM's total land area is quite small, it has an exclusive economic zone (EEZ) of more than 2 600 000 km². The capital is Palikir, located on Pohnpei State, while the largest city is Weno, located in Chuuk State.

For administrative purposes, the four states are divided into municipalities (Yap - 20; Chuuk - 40; Pohnpei - 11; Kosrae - 4). Each state has different cultures, languages and agricultural and fishing practices.

1.1.1 Climate

Micronesia has a tropical climate with little seasonal variation in monthly mean maximum and minimum air temperatures. As a small island developing nation, FSM is one of the countries most directly threatened by long-term global warming. Climate projections for FSM suggest:

- El Niño and La Niña events will continue to occur in the future, but there is little consensus on whether these events will change in intensity or frequency.
- Annual mean temperatures and extremely high daily temperatures will continue to rise.
- Average annual rainfall is projected to increase, with more extreme rain events.
- Drought frequency is projected to decrease.
- Sea level will continue to rise.
- Ocean acidification is expected to continue.
- The risk of coral bleaching is expected to increase.
- Wave height is projected to decrease in December-March, and waves may be more directed from the south in June-September.
- Typhoons are projected to be less frequent but more intense.

These changes are already affecting the quality and yield of local crops, as well as FSM's marine food resources⁴.

Cyclone Maysak in May 2015 had a significant impact on FSM, particularly in Chuuk and Yap and recovery was still underway at the time of the 2016 Integrated Agriculture Census.

1.1.2 Economy

The Federated States of Micronesia (FSM) gained independence in 1986 under a Compact of Free Association with the US, which was amended in 2004. Under the terms of the original Compact, the US provided \$1.3 billion in grants and aid from 1986 to 2001. The US and the Federated States of Micronesia negotiated a second (amended) Compact agreement in 2002–2003 that took effect in 2004. The amended Compact runs for a 20-year period to 2023, during which the US is providing roughly \$2.1 billion to FSM. The amended Compact also develops a trust fund for FSM that is intended to provide a comparable income stream beyond 2024 when Compact grants end.

⁴ Current and future climate of the Federated States of Micronesia: https://www.pacificclimatechangescience.org/wp-content/uploads/2013/06/7_PACCSAP-FSM-11pp_WEB.pdf accessed July 2019

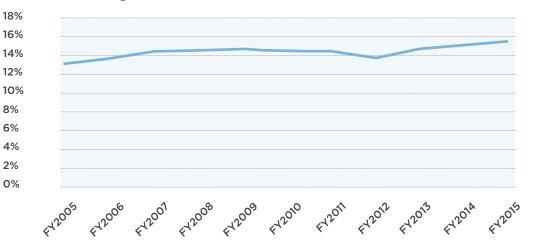

⁵ See ECONOMIC REVIEW FSM Fiscal Year 2017 for details of FSM's economy.

Economic activity⁵ in FSM consists largely of subsistence farming and fishing, and government, which employs two-thirds of the adult working population and receives funding largely from Compact of Free Association assistance provided by the US.

Although FSM generated fiscal surpluses after FY14 with rising fishing fee revenues, and overall economic growth has been positive recently, the agriculture sector and domestic fishing continues to provide food and livelihood for a significant proportion of FSM population.

GRAPH 1

Contribution of agriculture to GDP: 2017

Source: ECONOMIC REVIEW FSM Fiscal Year 2017 statistical tables

Estimates for agriculture in the Gross Domestic Product (GDP) (largely for home consumption) indicate a long-run upward trend of 1.2 percent per annum, suggesting that in the absence of other economic opportunities or emigration, households have returned to subsistence production to support themselves.

The agriculture sector was earmarked in National Strategic Development Plan 2003-2023 as one of the three prioritized areas for development to propel the nation towards self-sufficiency. This led to the adoption of FSM Agriculture Policy 2012-2016⁶.

1.2 The Integrated Agriculture Census 2016

1.2.1 The Objectives of the Integrated Agriculture Census

As the first agriculture census for FSM, the Integrated Agriculture Census aims to provide baseline data and a framework for other surveys of agricultural holdings.

Some specific objectives of the census were:

- 1. To provide baseline data on the structure of agriculture, especially for smaller farmers/fishers. The last agriculture census was in 1969.
- 2. To provide policy makers with a minimum set of core data, for evidence-based policy development and project monitoring and evaluation purposes.
- 3. To provide benchmarks to improve current crop and livestock statistics and to provide sampling frames for follow-up agricultural sample surveys.
- 4. To establish a sustainable plan for ensuring regular updating of agriculture, forestry, fishery and livestock data (at least every two years) through integration with other national survey tools.

[•]

⁶ Federated States of Micronesia Agriculture Policy 2012-2016

The census of agriculture provides a snapshot of agriculture and will help identify possible areas of intervention. Some uses are:

- In promoting agricultural production and investments, to stimulate economic growth.
- For the preparation of rural development activities, for supporting the market orientation of agricultural producers and programs for infrastructure development.
- To analyzed agriculture sustainability and productivity. The use of land can have environmental consequences that range from pollution of waterways to global warming and the census of agriculture is the main source of data on the actual land use in a country.
- Developing policies and programs addressing the needs of specific target groups young farmers, subsistence producers, land consolidation measures, etc.

The IAC results provide the baseline and start of an integrated program of data collection and compilation aimed at providing an ongoing picture of agriculture's contribution to FSM's economy and sustainability.

1.2.2 Background

The integrated Agriculture Census was carried out by the Department of Resource and Development (jointly by the Resource Management and Development Division and the Statistics Division). It was carried out under the Statistics and Census Act of 1988 (also referred to as Public Law 5-77).

A full census was agreed as there had been no census of agriculture conducted in the Federated States of Micronesia. This included full coverage of all private households, including town residents, as most people have access to land and carry out agricultural activities. Non-private households were excluded from the IAC. In 2010 about 0.5 percent of occupied households were non-private households, containing about 1.2 percent of the total population (1 220 people).

1.2.3 Questionnaire

As this was the first national agriculture census and very little agricultural data of any type was available for FSM, there was a desire to cover as many topics as possible. The sections of the agriculture census questionnaire were:

- S.1 Demographic profile and Labor Force status
- S.2 Land characteristics of land operated alone and shared with other households
- S.3 Crops planted, harvested, sold
- S.4 Livestock & Pets
- S.5 Fisheries and Aquaculture
- S.6 Forestry, Hunting and Handicraft
- S.7 Equipment
- S.8 Services, Barriers, Income and Credit

See Appendix 3. The census questionnaire coverage was quite extensive, and hence, very lengthy. Its length may have compromised the quality in some areas. There were a number of problems encountered in carrying out the 2016 IAC.

The collection of land area data was difficult – people often do not know or have information to estimate land areas, land can be shared among a number of households and operated jointly, boundaries are unclear and in some places there are limited official records and land ownership may be disputed. Up to three parcels each of shared and unshared land were recorded for crop planting and harvesting, but analysis of the total area operated by households is not considered to be very reliable.

The area of crops was not specifically asked, as most agriculture in FSM is mixed planting or agroforestry. The questionnaire put emphasis on the number of planting and amount harvested by the household. Crop harvest data quantities were collected in a range of units that were not able to be fully analyzed for this report.

1.2.4 Census enumeration

Over 700 enumerators and supervisors were deployed in the field from June 30, 2016. The census was intended to be completed in July 2016, with a recall period of one year.

Logistical constraints meant that some islands were not covered until late in 2016, and there were some areas that were not well covered. In particular, there were difficulties in Chuuk and some households were imputed from neighbouring households, and an adjustment factor was applied to account for under-coverage.

By the end of enumeration, 14 989 useable questionnaires were completed, estimated to represent 15 545 households after adjusting for under-coverage.

1.2.5 Processing, tabulation and analysis

Delays and funding difficulties meant that developing the systems, the data entry, editing, tabulation and analysis were all carried out by different people at different times.

The data entry system was developed in CSPro, a data entry system supplied by the United States Bureau of the Census, based on the questionnaire format. Data entry was delayed due to resourcing issues and was not completed until 2018.

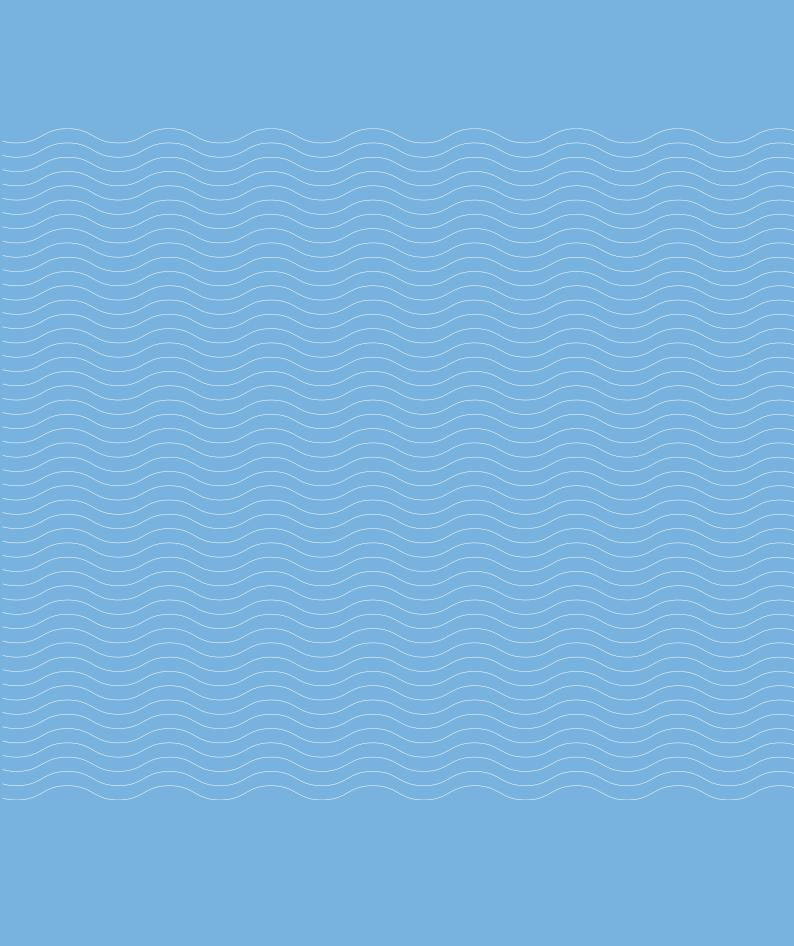

A full set of tables by municipality was developed based around the questionnaire content. For this report additional analytical tables were produced, but not all derivations needed were available.

In some cases, there are inconsistencies in the numbers presented in this report. These occur for two reasons: in some cases the numbers of non-respondents for questions have been left out of the tables, and in other cases it reflects that the respondents may have misunderstood the questions.

See Appendix 2 for a full list of tables available on request from the FSM Department of Resources and Development Statistical Division.

Full details of the methodology and issues are given in a separate report.

2.1 The population covered by the Agriculture Census

The FSM Integrated Agriculture Census (IAC) 2016 reports on 87 357 people in 15 545 households. This compares to the 2013/14 HIES⁸ (estimated 103 382 people) and the Census 2010 (102 839 people).

Overall the population age and sex distribution in the 2016 IAC shows the impact of migration and birth rate changes, as well as possible undercount.

Agriculture activities remains crucial to livelihood of FSM households. The occupation and industry data shows 36 percent of the work force were skilled agricultural forestry and fisheries workers.

The extent of subsistence activity in agriculture is clear, with 92 percent of those working in agricultural occupations being unpaid, compared to just under 60 percent of all those participating in the labor force.

2.2 Characteristics of the households with land used for agriculture

Just over 90 percent of households recorded in the Agriculture census had access to land they used for agriculture. These are also referred to as farm households in this report.

Although the age and sex distributions are very similar for those households that have land for agriculture and those that do not, there are some differences. There was a higher proportion of children and a lower proportion of older people in the farm households.

The households that have land for agriculture have more people in them while those without land used for agriculture have a high proportion of one-, two- and three-person households.

The householder in 80 percent of households was male across FSM. Yap had the highest proportion of female householders, 26 percent, compared to 18 percent in Chuuk, 21 percent in Pohnpei and 17 percent in Kosrae. This reflects the pattern in households with land used for agriculture.

TABLE 2.3

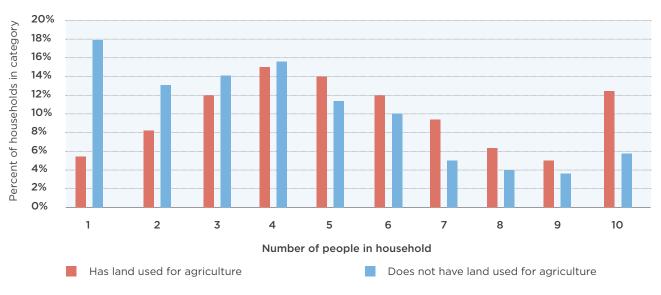

Number of households with land used for agriculture by state: 2016

	NUMBER OF HOUSEHOLDS			PERCENT	
	TOTAL	HAS LAND USED FOR AGRICULTURAL PURPOSES	DOES NOT HAVE LAND	HAS LAND USED FOR AGRICULTURAL PURPOSES	DOES NOT HAVE LAND

Source: FSM 2016 Integrated Agriculture Census

GRAPH 2.1

Number of people in households by whether they have land used for agriculture: 2016

Source: FSM 2016 Integrated Agriculture Census

2.2.1 Main activities of people 15 and over

In households with land used for agriculture, 30 percent of males and 19 percent of females aged 15 and over reported they were in paid employment. This varied across states with paid employment reported for 44 percent of males and 28 percent of females in Yap compared to 18 percent of males and 12 percent of females in Chuuk, 39 percent of males and 23 percent of females in Pohnpei and 41 percent of males and 24 percent of females in Kosrae.

Across FSM, more people aged 15 and over reported being in unpaid work (around 19 866 people) than in paid work (14 552 people). However, this is driven by the situation in Chuuk, where 11 260 people reported being in unpaid work compared to 3 899 in paid work. In all other states there were more people reported in paid than unpaid work.

Males reporting unpaid work were mostly (75 percent) producing goods for own and/or family consumption. For females, the largest proportion (58 percent) of unpaid workers were unpaid family workers helping with home duties home duties.

More than half of females aged 15 and over (15 167 people, or 51 percent) reported not being in the labor force, and most of these reported their main activities as home duties. However, in Yap, 60 percent of females reported being in the labor force with close 28 percent in paid work and another 28 percent producing goods for own and/or family consumption.

Students made up 11 percent of the people aged 15 and over in households with land used for agriculture, for both males and females.

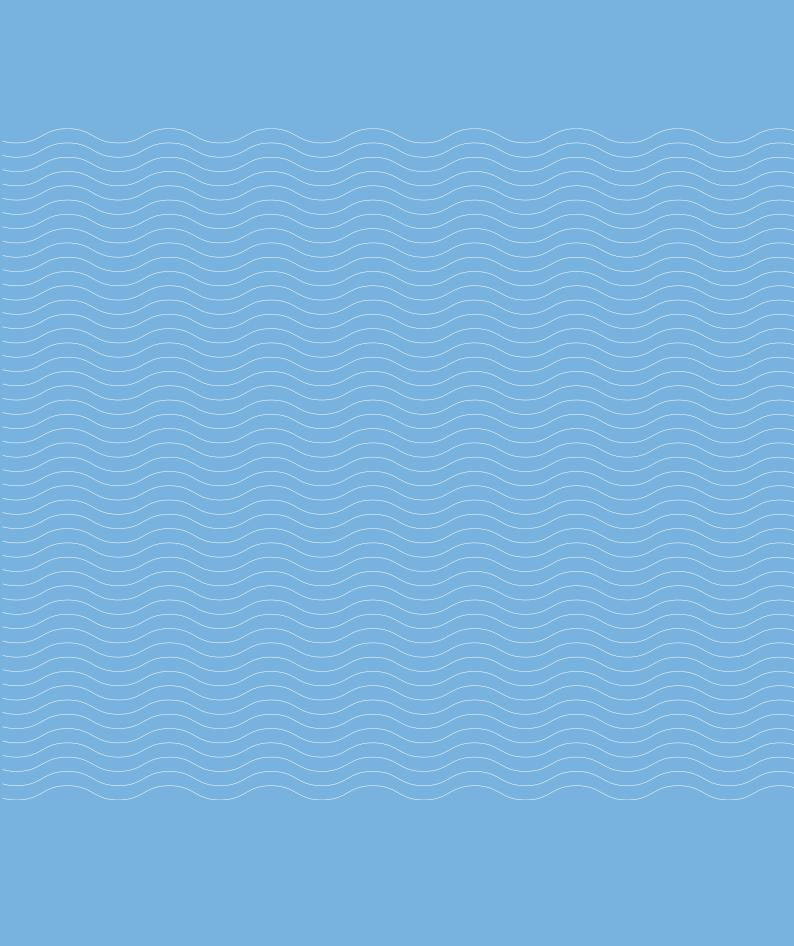

2.2.2 Education

Most of the people aged 15 and over in households with land used for agriculture had not graduated from high school – 58 percent of males and 59 percent of females. Twenty percent of males and 21 percent of females reported that they had graduated from high school, and 12 percent of males and 11 percent of females reported some college but no degree.

2.2.3 Characteristics of the main operator

The main operators of the farming activity in 2016 were reported to be mostly male – 77 percent. When the main operator was reported to be female, nearly half (48 percent) were aged over 55, compared to 32 percent of male main operators. A significantly higher proportion of main operators were in paid employment – (36 percent) than in the farm household population (25 percent). This is not just because of the high proportion of male main operators, as the proportion of all males in farm households in paid employment was 30 percent.

As noted in Section 1, there are many issues with the collection of land area. However, there is little pre-existing information available about land use, and the information presented here is a starting point.

3.1 Area of agriculture

The shared operation of some land means that it is not possible to be sure about the area of land in agriculture as some parcels are likely to be counted by two or more households. An estimate of the area of land used for agriculture derived from the information collected showed that just under half of the area of FSM may be used for agriculture. The table below is based on summing the area of household operated (not shared) and shared parcels of land, so will overestimate the total area used for agriculture.

TABLE 3.1

Estimated proportion of total area used for agriculture: 2016

	TOTAL	YAP	CHUUK	POHNPEI	KOSRAE
Area of state ¹⁰ in acres	172 974	25 432	23 256	94 200	30 085
Estimated area of land used for agriculture	69 038	11 828	16 277	37 954	2 979
Land used for agriculture as % of total land	40	47	70	40	10

Source: FSM 2016 Integrated Agriculture Census

Estimates from 2005/06 reported in the FAO Global Forest Resources Assessment 2015 estimated that 43 340 acres across FSM was used for agroforestry, palm crops and other crops.

Over FSM, 62 percent of households with land for agriculture had an average of 1.4 parcels of land that were only operated by their household. The proportion of households with land for agriculture that shared land with other households was 54 percent, who had an average of 1.6 shared parcels of land. In Pohnpei 41 percent of households reported using shared land parcels, the lowest incidence of shared land across the states.

3.2 Tenure

Security of tenure can affect the amount of investment in agriculture. FSM has a complex system of traditional ownership that dates back centuries. Many parcels of land are held by families or clans that may have different factions, all of whom assert interest in the land. This complicates both the use of the land and the recording of tenure and use of the land.

Most land used for agriculture was reported to be freehold land or held with customary titles. About eight percent of the land parcels used for agriculture were leased or had other tenure.

TABLE 3.2
Tenure of shared and not shared land parcels: 2016

	NOT SHARED I	LAND PARCELS	SHARED LAND PARCELS	
	NUMBER	PERCENT	NUMBER	PERCENT

[•]

¹⁰ FAO Global Forest Resources Assessment 2015, Based on 2005/06 figures calibrated to 700 square kilometres.

¹¹ ADB 2015 Understanding Land Issues and Their Impact on Tourism Development, quoting FSM government website unable to be accessed at September 2019

Yap had the greatest reported reliance on customary land, with 79 percent of single household operated parcels and 84 percent of shared parcels in customary tenure. In Yap only 15 percent of single household operated parcels were freehold land, while all other states reported over 70 percent freehold for single household operated parcels.

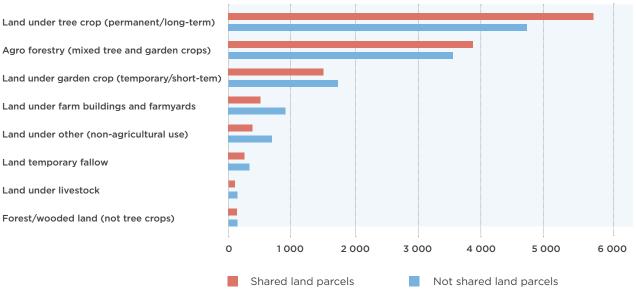

Shared land parcels are more likely to be in customary tenure in other states, with 49 percent of shared parcels in customary ownership in Kosrae, 37 percent of shared parcels in customary ownership in Chuuk and 20 percent of shared parcels in customary ownership in Pohnpei.

3.3 Land use and purpose

Much of the land is used for agroforestry and tree crops, with 70 percent of household operated (not shared) parcels and 80 percent of shared parcels of land mainly under tree crops or agroforestry.

GRAPH 3.1

Number parcels of shared and not shared land by main use: 2016

Source: FSM 2016 Integrated Agriculture Census

Land that is not shared is more often used for garden crops, farm buildings and non-agricultural purposes, while shared land is more likely to be agroforestry or tree crops.

The main purpose of the land is to provide produce for home consumption.

- Over 74 percent of households reported that the main purpose of the use of the land was only for home consumption.
- For 24 percent of households the main purpose was for home consumption with occasional sales.
- Less than two percent of households reported that they used the land mainly or only for sales.

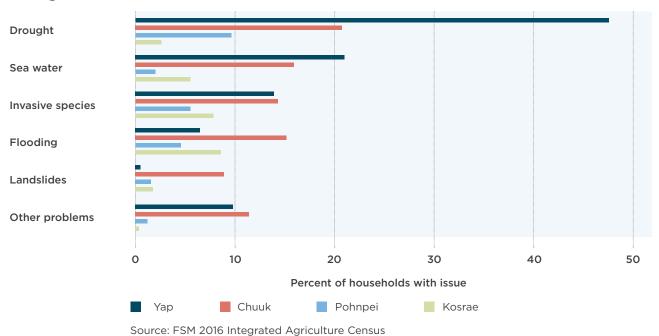

Although only 26 percent reported that the main purpose of land use included sales, analysis of crop data shows that nearly 40 percent of households had sold some of the main crops.

3.4 Land issues and management

As noted above, climate change is affecting FSM and many households with land used for agriculture reported problems that affected their use of the land. Yap and Chuuk reported higher rates of issues, with drought affecting 45 percent of those households in Yap, compared to 21 percent in Chuuk, 9 percent in Pohnpei and 3 percent in Kosrae. Seawater incursion and invasive species also affected more land in Yap and Chuuk, and Chuuk also reported the highest rates of flooding, landslides and other problems.

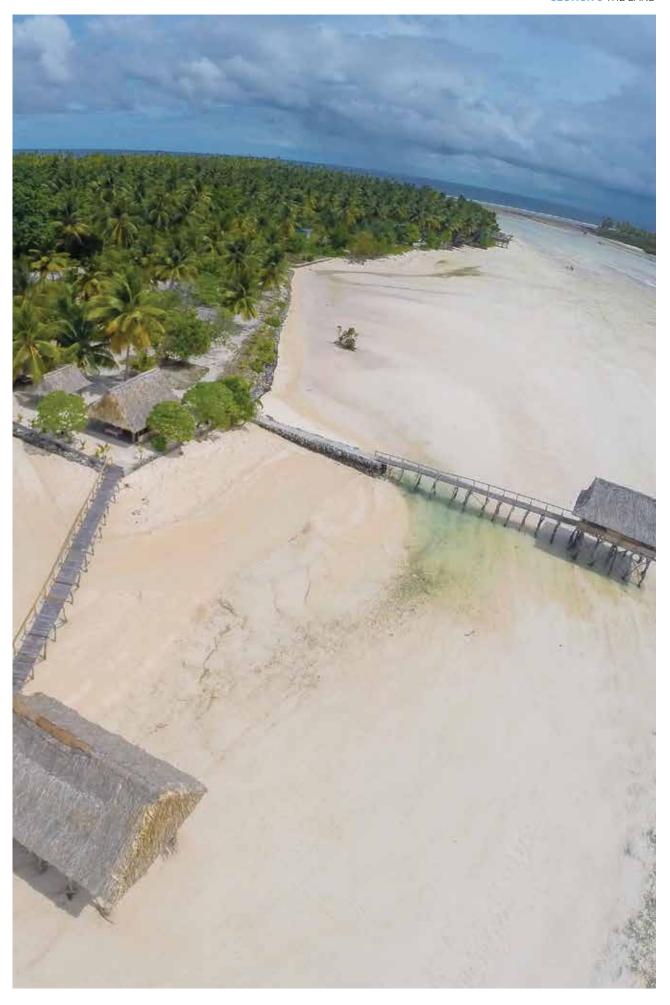

GRAPH 3.2

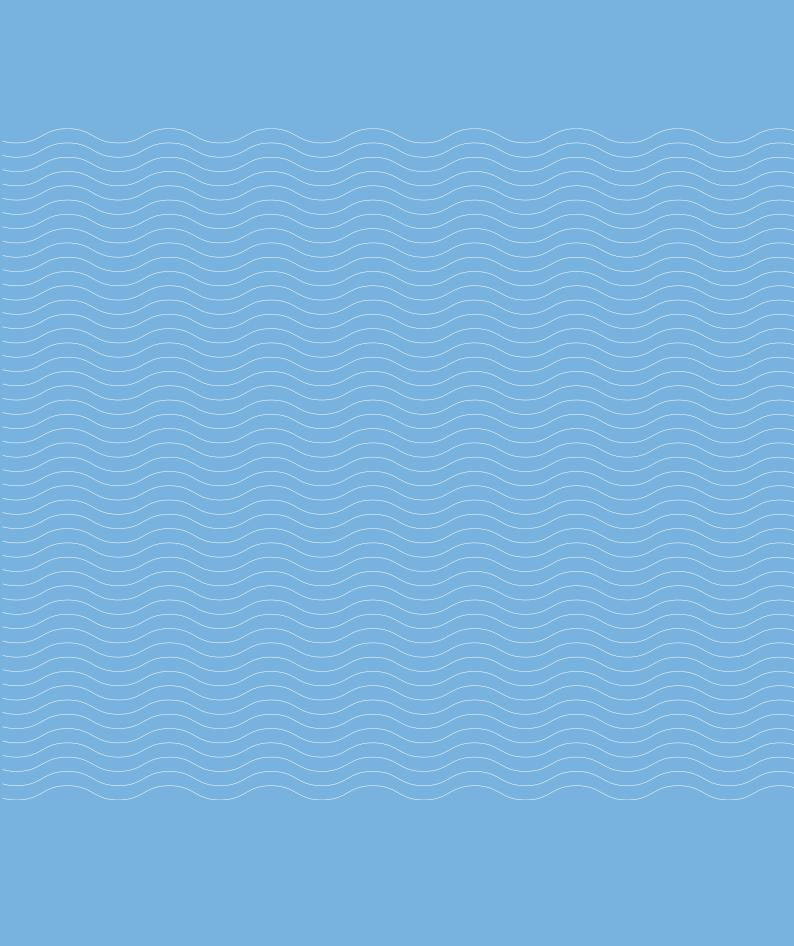

Damage to land: 2016

Little irrigation or drainage has been implemented, with less than two percent of farm households in FSM reporting irrigation, and just over three percent reporting drainage or other water management.

In some areas land is also burnt off for planting. The highest rate is in Yap where eight percent of households with land for agriculture reported this.

Crops in FSM reflect the tropical, Pacific agricultural conditions and are mostly based around supplying household needs. There is little access to international markets and limited tourism, reducing the market opportunities for farmers.

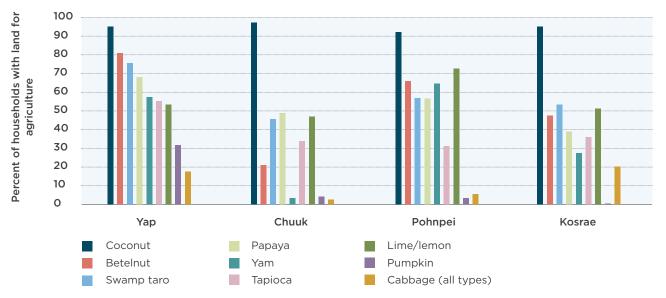

The area of crops was not specifically asked in the questionnaire, as most agriculture in FSM is mixed planting or agroforestry. The analysis focuses on the numbers of households undertaking activities with crops.

4.1 Crops grown

Over 90 percent of households with land for agriculture grew the staple crops of coconut, breadfruit and banana across all states. No other crops were grown by more than 60 percent of households with land for agriculture, and the popular crops vary across states, as illustrated the graph below.

GRAPH 4.1

Percent of households with land for agriculture growing selected crops, by state: 2016

Source: FSM 2016 Integrated Agriculture Census

Coconut, breadfruit and banana are grown on the land of over 90 percent of households in all states. The next most common tree crop was lime/lemon, grown by 8 250 households or 59 percent. These were more popular in Pohnpei and Kosrae where lime/lemon was reported by over 70 percent of households.

Vegetables were only reported grown by a small proportion of households. The most commonly grown vegetable crop was pepper (chili and bell) grown by 2 411 households, or 17 percent across FSM. This was most common in Yap where 980 households or 46 percent reported growing peppers.

A variety of root crops were reported grown. Yam was reported grown by 5 073 households or 36 percent. It was most commonly reported in Pohnpei, where 64 percent of households reported it, and Yap with 57 percent reporting. In Kosrae 27 percent and Chuuk 5 percent of households reported growing yam. Swamp taro was reported grown by 54 percent of households, land taro by 48 percent of households and tapioca by 36 percent of households. Sweet potato was reported by 13 percent of households over FSM but was more commonly grown in Yap where 48 percent of households reported it.

Other crops reported grown included sakau (kava) reported by 3 382 households, almost all of whom were in Pohnpei. Betelnut was more widely reported grown, by 6 816 households or 49 percent across FSM. In Yap 81 percent of households reported growing Betelnut.

Piper leaves and ornamental plants were reported by just under 20 percent of households.

Black pepper, which has had a high value in the past - "Pohnpei black peppercorns were highly praised by gourmets for their distinctive spicy yet somewhat sweet taste" was reported grown in Pohnpei by 72 households.

¹² The Kaselehlie Press, November 6, 2018 http://www.kpress.info/index.php?option=com_content&view=article&id=1138:sc ientist-on-a-mission-to-help-farmers-make-pohnpei-black-pepper-great-again&catid=8:news&Itemid=103

4.2 Planting methods

Planting methods for all crops were analyzed using data only for the first plot of land reported. This indicated that in 2016 most tree crops are grown in scattered plantings, mixed with other crops. Vegetables are more likely to be cultivated separately, with single cropping reported for more than 50 percent of cabbage, cucumber, beans and green onions. Pumpkin, squash and peppers (chilli and bell) were more often mixed crops and scattered plants.

Root crops such as swamp taro, tapioca, sweet potato and land taro all had relatively higher levels of single cropping.

Few plants were planted under any form of cover, apart from natural tree cover. Natural tree cover was most reported for sakau (45 percent of the crop), yam (42 percent) piper leaves (41 percent) and black pepper (40 percent under natural tree cover). Cover made from local materials was also reported for 14 percent of yam plantings and 11 percent of cucumber plantings.

Some of the tree crops grow almost wild, but nearly 30 percent of households reported planting bananas in the past 12 months, and around 20 percent of households planted coconut and breadfruit.

Looking at the households already growing the crop around 50 percent of households in Yap reported planting each of coconut, banana and breadfruit in the previous 12 months, but only 31 percent in Pohnpei.

Planting material was mostly sourced from the farmer's own material. For breadfruit, coconut and banana, agriculture extension supplied a small percentage of the planting material. The highest numbers were in Chuuk, where 139 famers were supplied with breadfruit (10 percent of the households reporting their planting materials).

However, for vegetable crops there was more reported sourcing planting materials from agriculture extension offices or purchasing. In Chuuk, it was reported that the extension offices supplied 48 percent of the planting material for cabbage, 34 percent for cucumber and 40 percent for beans. For all crops other than vegetables 90 percent or more of the planting material was the farmer's own.

4.3 Crops harvested

The most common crops - breadfruit, coconut and banana - were also the most harvested, with over 90 percent of households reporting harvesting some of their crop in the previous year. With the agriculture in FSM being less formal and some crops growing semi-wild, not all crops are harvested each year. On average across FSM for most other crops, between 70 and 90 percent of households that grew a crop report that they had harvested it.

However Kosrae reported lower levels of crops being harvested. For example, of the households that had yam or sweet potato on the land in Kosrae, only 41 percent had harvested the product.

The total amount harvested was not able to be analyzed, as harvest could be reported in pounds, each, bunch or other units and conversion factors were not available.

4.4 Crop sales

Although the purpose of growing is mostly for home consumption, there were reported sales in the past year of all crops grown. The most commercial crop is sakau, with sales by 57 percent of households growing the crop. Pohnpei is the driver of this - 98 percent of the households selling sakau were in Pohnpei.

Other crops reported sold by more than 40 percent of the households that grew the crop were:

- Cucumber (45 percent of growers sold)
- Betelnut (45 percent of growers sold)
- Swamp taro (43 percent of growers sold)
- Coconut (42 percent of growers sold)
- Breadfruit (41 percent of growers sold).

In the previous 12 months around 50 percent of households in Yap reported selling each of coconut, banana and breadfruit, but only 31 percent of households in Pohnpei.

Mostly households that reported selling crops sold only a proportion of the crops. The crops that had higher proportions sold were cabbage and sakau; two thirds of the households that sold these crops sold more than half of their harvest.

TABLE 4.1
Ten crops with the most sellers selling more than half the harvest: 2016

	NUMBER OF HOUSE- HOLDS GROWING	NUMBER OF HOUSE- HOLDS SELLING	PERCENT SELLING MORE THAN 50% OF HARVEST
Sakau	3 382	1942	66.7
Cabbage (all types)	1 000	278	66.2
Cucumber	930	423	58.6
Beans	833	238	58.0
Pandanus	3 069	700	56.2
Other crops	1 080	374	55.9
Betelnut	6 816	3 092	54.1
Piper leaves	2 491	993	53.2
Green onion	243	41	52.4
Pumpkin	1 182	283	49.3

Source: FSM 2016 Integrated Agriculture Census

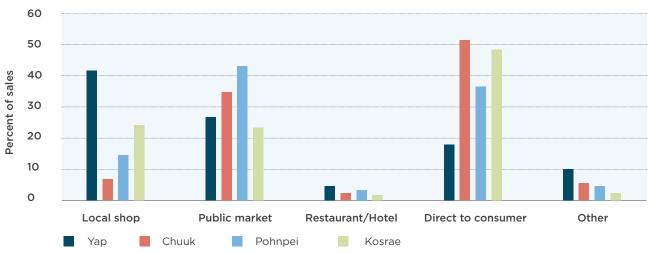

On the other hand, breadfruit had the lowest proportion sold. Less than 30 percent of the households sold more than half of the crop, indicating its importance for home consumption.

Across all crops and states the largest number of sales reported were directly to the consumer (38 percent) closely followed by sales to a public market (35 percent). Sales to a local shop were also significant at 19 percent, but sales to a restaurant or hotel were low at 2 percent, less than sales reported to others at 6 percent.

The markets for the crops vary depending on the product and state.

GRAPH 4.2

Markets sold to by state: 2016

Source: FSM 2016 Integrated Agriculture Census

Restaurant and hotel sales are low, with limited tourism across all states in FSM. However they provide an additional market for vegetables and some tree crops.

The public market was most important for vegetables and some fruit crops, and for root crops in Pohnpei. Although sakau (in Pohnpei) and betelnut were more often sold direct to the consumer, sellers also sold both public markets and local stores.

4.5 Crop losses

Traditional crops were the most robust (resistant to losses) but at least 60 percent of households with land for agriculture experienced some loss from weather, diseases, pests, theft or other reasons for any crop.

The crops with the highest rates of no loss reported in the 2016 IAC were:

- sakau with 39 percent of growers reporting no loss,
- betelnut (28 percent),
- yam (28 percent),
- · coconut (26 percent),
- swamp taro (26 percent) and
- cucumber (25 percent).

However, even for these crops there were significant numbers of growers that reported loss.

Weather damage was the most reported, with many crops having ten percent or more land parcels with losses of the crop in 2016. The highest reported rates of damage were to betelnut, breadfruit, piper leaves, banana, coconut, swamp taro, tapioca and sakau all of which had reported weather damage to between 20 and 30 percent of parcels of land with the crop.

Theft was another significant issue for some crops with growers reporting losses on more than 20 percent of land parcels for sakau, betelnut, coconut and other root crops.

Vegetables and fruits were susceptible to pests, with loss for more than ten percent of growers for many of these. The highest losses were for cucumber, cabbages, banana and other fruits.

The crops with the highest reported rates of losses from diseases, with more than ten percent of growers reporting losses, were piper leaves, sakau, cucumber, breadfruit, yam and swamp taro.

4.6 Crop workers

Across FSM, 37 percent of people aged 15 and over worked on crop activities. A total of 22 659 people were recorded as working on crop activities, of whom 841 were children under the age of 15. Males made up 64.3 percent of the crop workers, while females made up 35.7 percent. Around 60 percent of males aged 35–64 did crop work, but only 30 percent of males aged 15–24.

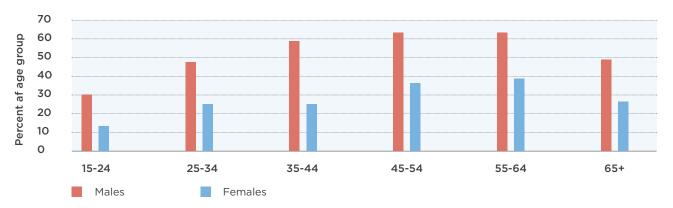

However, the make-up of crop work varies across the states. In Yap, females take more responsibility for crop work and made up 62.4 percent of the crop workers, while males made up 37.6 percent of the workers.

Work on crops is spread across household members. Households with land for agriculture in Yap had on average 2.0 members of the household involved in livestock activities, while in Chuuk the average was 1.5, Pohnpei 1.6 and in Kosrae 1.3.

In Pohnpei, 30 percent of those who worked on crop farming worked 20 or more hours in the week, and in Chuuk 28 percent of those who worked on crop farming worked 20 or more hours in the week compared to 17 percent of the workers in both Yap and Kosrae.

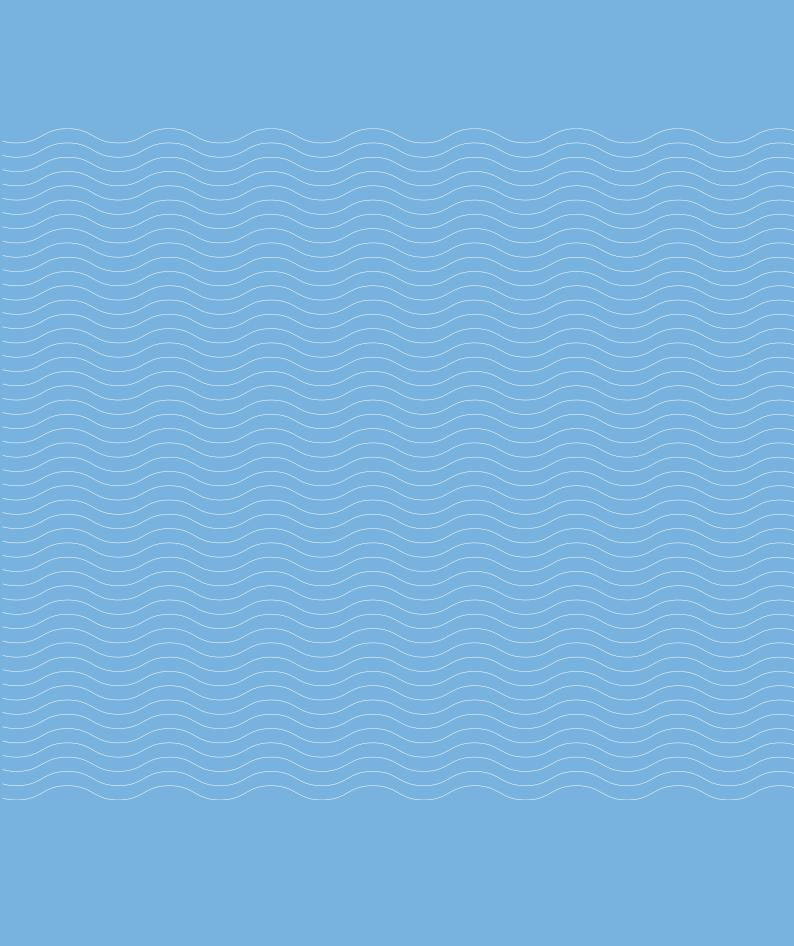

GRAPH 4.3
Percent of population involved in crop activities by age and sex: 2016

Source: FSM Integrated Agriculture Census 2016

Few workers had any formal education in agriculture, with 473 people (2.1 percent of the crop workers) having secondary or post-secondary education in agriculture. A small number, 798 people or 3.5 percent had participated in short courses, but most had no formal education (11 446 people or 50.4 percent) or informal practical education (9 974 people or 44.0 percent). Informal practical education was described as "For example, an extension officer coming to your farm or village and showing you something. Training provided by family is not included". Informal practical education was reported by 44.0 percent in Yap, 51.3 percent in Chuuk, 38.7 percent in Pohnpei and 29.2 in Kosrae.

Some households had hired workers for crop activities – over FSM 1 224 households (8.7 percent of those with land for agriculture) had hired workers in the last 12 months. The largest number of households hired workers in Chuuk (698 households or 12.2 percent of those with land for agriculture) and in Pohnpei (415 households or 7.97 percent). The workers may have been hired for short periods to help with specific tasks, or for longer periods.

Livestock production (pigs and poultry) is important throughout FSM, particularly for subsistence and cultural use¹⁴. Livestock production numbers and use of services and sustainable practices are important indicators of the investment in livestock. Across FSM, 9,434 households (61 percent) had livestock.

SECTION 5 LIVESTOCK

Traditionally, pigs were raised by nearly every family for ceremonial and cultural purposes, such as weddings, funerals and feasts of celebration¹⁵. However, in the 2016 IAC less than 50 percent of households reported that they kept any pigs.

Dogs were reported kept by 42 percent of households and chickens (local breeds) by 32 percent of households. In total:

- There were 70 800 chickens reported (compared to 79 900 reported in the 2013/14 HIES)
- 29 900 pigs (compared to 25 000 reported in the 2013/14 HIES)
- 16 600 dogs, (compared to 14 000 reported in the 2013/14 HIES)

Yap and Pohnpei reported higher rates of keeping animals.

5.2 Consumption and sales

Most livestock were kept for home consumption, but a significant proportion was gifted or sold.

In terms of numbers, 78 percent of chickens were reported to be consumed at home, with 91 percent reported consumed at home in Yap.

Pigs were often consumed at home (42 percent of animals reported disposed of) but they were also widely used for social and customary obligations, particularly in Pohnpei for 49 percent of animals reported disposed of. While many piglets were consumed at home, they were more often sold than used for customary purposes. In Yap, 87 percent of the piglets disposed of were sold.

The reported value of livestock sold was \$902 702. Based on this and the reported numbers of animals sold, consumed at home and gifted, the overall value of the livestock production in FSM was estimated to be \$4.821 million. This compared to an estimate of \$3.909 million in 2013/14 HIES. Of this value:

- 48 percent was consumed at home (compared to 43 percent in 2013/14 HIES)
- 34 percent was gifted (compared to 27 percent in 2013/14 HIES)
- 19 percent was sold (compared to 30 percent in 2013/14 HIES).

5.3 Livestock practices

Most pigs were kept in fenced enclosures or cages, except in Chuuk, where most were free ranging. Most other animals/poultry were free ranging. This meant that waste disposal was in the open in most cases. Some use of recycling or bio-gas generation from pig waste was reported, with 2.4 percent of households with pigs reporting this across FSM. The highest rate was in Chuuk.

Feed was purchased for some animals, particularly pigs, and most often in Pohnpei and Kosrae.

TABLE 5.4

Rates of feed purchase for animals by state 2016

Dogs	8.5	3.3	5.5	13.3	10.0

Source: FSM 2016 Integrated Agriculture Census

Few households had used any services for animals. A total of 779 instances of vaccination were reported, mostly for pigs. A low rate of use of castration services was reported (six percent of pigs) but most male pigs are castrated at home without assistance.

In Kosrae, higher rates of services were reported with more than half of the households with chickens reporting use of some services. Vaccination/dosing rates in Kosrae were 21 percent of pigs, 18 percent of piglets and 16 percent of chickens reported vaccinated.

5.4 Livestock workers

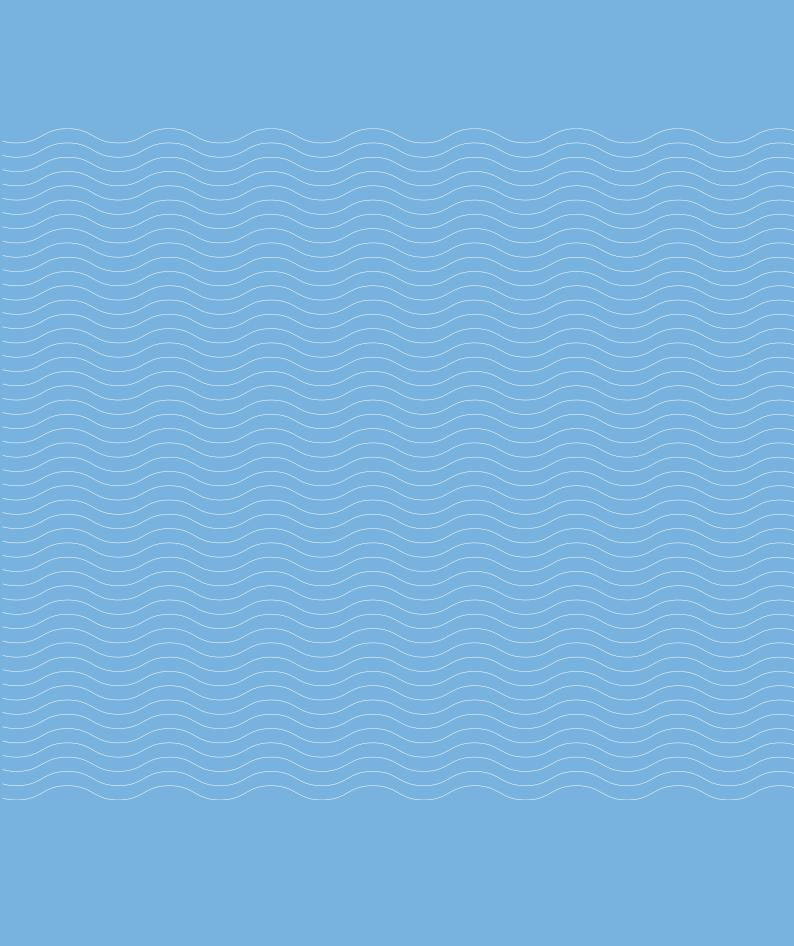

Across FSM, 24 percent of people aged 15 and over worked on livestock activities. A total of 14 688 people were recorded as working on crop activities, or about two-thirds of the number involved in crop activities. Of these, 781 were children under the age of 15. Males made up 63 percent of the livestock workers, while females made up 37 percent. Livestock work was spread across all age groups, with a higher proportion of older age groups.

As with crop work, the gender balance of livestock work varies across the states. In Yap, females made up 55 percent of the crop workers, in Chuuk 36 percent, in Pohnpei 31 percent, and in Kosrae 14 percent.

Work on livestock is also spread across household members in the same way as crop work. On average, households with livestock in Yap had 2.0 members of the household involved in livestock activities, while in Chuuk and Pohnpei the average was 1.5, and in Kosrae 1.3. This difference is reflected in the hours worked. In Yap the median hours worked was less than five hours, whereas in other states it was between five and ten hours.

As the population involved in livestock work is very similar to that involved in crop work, the education pattern is also similar, with 47 percent reporting informal practical education about livestock. Again, this varied across the states, with 49 percent of people who were normally engaged in livestock activities in Yap reporting that they had received informal practical education about livestock, compared to 59 percent in Chuuk, 37 percent in Pohnpei and 29 percent in Kosrae.

SECTION

FISHERIES AND AQUACULTURE

Coastal fishing in the Federated States of Micronesia is carried out for subsistence purposes and for sale in local markets. The 2016 Integrated Agriculture Census asked all households interviewed about their fishing activities to help monitor the trends and practices in coastal fishing.

In 2016 8,508 households (55 percent of households in FSM) stated that they had fished in the past 12 months. Fishing was most reported in Chuuk, where 68 percent of household had fished. Yap reported 61 percent of households fished, Kosrae reported 46 percent and Pohnpei reported the lowest proportion of households at 41 percent. This rate of fishing is mostly consistent with the 2013/14 HIES for FSM, except for Chuuk, where the rate of fishing reported was significantly higher than the 49 percent estimated in 2013.

On average, fishing households in FSM reported making 8.5 fishing trips a month. Households were asked how many fishing trips they made for each method of fishing, and also how many fishing trips they made for each area/habitat they fished in. Where a trip covered more than one method of fishing or more than one area the trip would be reported in each category, meaning some trips were counted multiple times.

6.1 Species caught and fishing methods

Many different species are caught, with the most common being reef fish species, caught by 80 percent of the households that engaged in fishing activity.

TABLE 6.1

Fishing activity and species caught: 2016

	FSM TOTAL	YAP	СНИИК	POHNPEI	KOSRAE
Number of fishing households Percent of households	8 508 54.7	1 378 60.5	4 222 67.8	2 434 40.5	474 45.7

Sea cucumber	15	2	22	11	5

Source: FSM 2016 Integrated Agriculture Census

Some species are more frequently caught in some states than others. After reef fish, octopus was the most caught, but mainly reported caught in Chuuk. In Chuuk, 74 percent of households reported catching octopus compared to 47 percent of households in Yap, 21 percent of households in Pohnpei and 6 percent of households in Kosrae. Tuna and other pelagic fish were the next most commonly caught, with Yap having the highest catch rate.

Note that fish classified as ornamental can be caught for consumption.

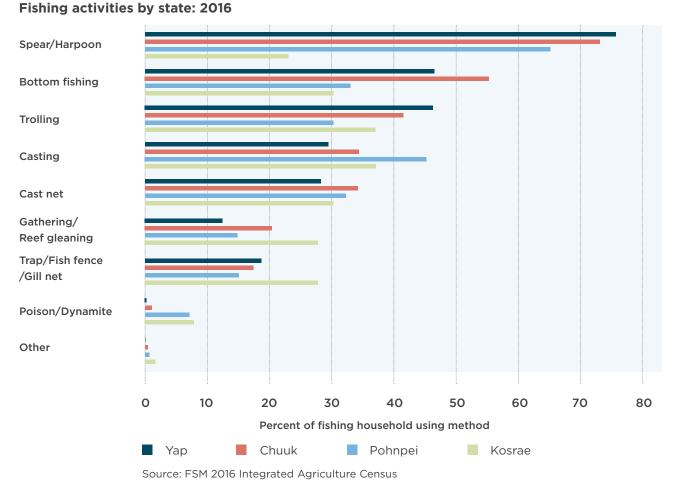

6.2 Fishing Methods

Spear or harpoon fishing is still the most used method of fishing in all states except Kosrae where trolling, casting and other methods were more used. Over FSM:

- spear/harpoon was reported by 68 percent of fishing households,
- bottom fishing (include drop stone) by 46 percent,
- trolling by 39 percent, casting (handline/pole) by 39 percent,
- · cast net by 33 percent,
- gathering or reef gleaning by 18 percent, and
- trap/fish fence/gill net fishing by 18.2 percent of fishing households.
- A small proportion of households used poisoning methods, dynamiting or other methods.

Many fishing households reported using more than one fishing method.

GRAPH 6.1

6.3 Areas fished in and frequency

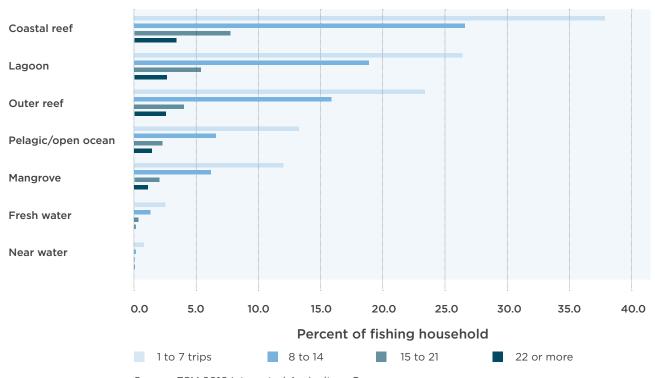

Fishing was most often reported in the coastal reefs, where 75 percent of fishing households reported that they had fished.

TABLE 6.2
Rates of feed purchase for animals by state, 2016

	FSM TOTAL	YAP	СНИИК	POHNPEI	KOSRAE
AREA/HABITAT		Percent of fis	hing households	fishing in area	
Coastal reef	75	87	75	71	61

Mangrove	21	19	20	25	19
Fresh water	4	1	3	6	11
Near a FAD	1	3	1	1	4
Other	0	0	0	0	0

Fishing trips can combine fishing in several areas or using more than one method in one outing. Overall, it is estimated from the FSM IAC 2016 that households visited an average of 20 different habitats a month, in an average of 8.5 fishing trips in a month.

GRAPH 6.2 Number of fishing trips per month to different habitats: 2016

Source: FSM 2016 Integrated Agriculture Census

While the most common number of trips per month was between one and seven - once or twice a week - 11 percent of fishing households said they went fishing in the coastal reef area 15 or more times a month, or four or more times a week.

6.4 Purpose of fishing and sales

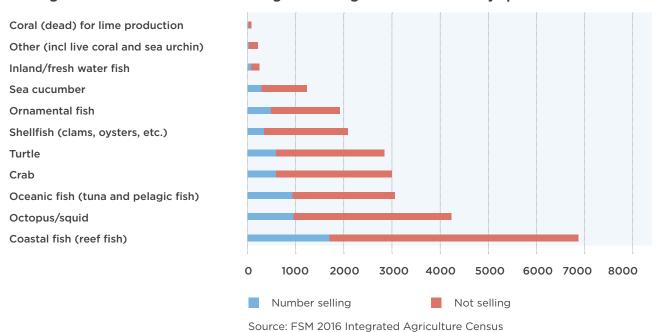

Most of the reported fishing was for home consumption. Few households reported catching any species mainly or only for home consumption. The species that were caught mainly or only for sales varied by state.

- In Yap and Kosrae less than ten households reported catching any species mainly or only for sale,
- In Chuuk seven percent of the households that caught oceanic fish (tuna and pelagic) reported that it was mainly or only for sale,
- In Pohnpei six percent of households that caught oceanic fish (tuna and pelagic) and five percent of households that caught lobster and crab reported that it was mainly or only for sale,

Despite this, a much larger number of households sold some part of their fish catch. Coastal reef fish and oceanic fish were the most sold, with 1 648 households reporting selling reef fish (24 percent of those that reported catching these fish) and 952 households reporting selling oceanic fish (31 percent of those that reported catching these fish). For all species, more than 15 percent of households reported selling some part of their catch. And for many households more than half of the catch was sold. For example, 65 percent of those reporting selling oceanic fish said they had sold more than half of their catch.

This suggests that although households consider their fishing activity as primarily for home consumption, the income received from selling parts of the catch makes some contribution to the household as well, particularly in Chuuk.

GRAPH 6.3
Fishing: Number of households catching and selling fish and seafood by species: 2016

6.5 Fishing workers

Across FSM, 18 percent of people aged 15 and over worked on fishing activities. Males made up 84.4 percent of the fishers, while females made up 15.6 percent.

In Yap, 5.5 percent of those involved in fishing were females, compared to 16.5 in Chuuk, 20.2 percent in Pohnpei and 20.4 of those involved in Kosrae. In Yap, more than 60 percent of males aged between 35 and 54 were engaged in fishing activities.

Note however that in Kosrae, there were fewer people reported involved in fishing that the number of households, indicating some under-reporting.

6.6 Aquaculture

Over FSM, 499 households (3.2 percent of all households) reported that they were involved in aquaculture.

TABLE 6.3
Aquaculture activity and species cultivated: 2016

	TOTAL	YAP	СНИИК	POHNPEI	KOSRAE

Freshwater species	7	Ο	8	9	5
Other	3	0	5	2	9

Source: FSM 2016 Integrated Agriculture Census

Clams were the most common species farmed. Across FSM 63 percent of the aquaculture households cultivated clams. In Yap, 90 percent of the aquaculture households cultivated clams. Other common species were sea cucumber (27 percent of the aquaculture households in FSM cultivated) and Trochus (17 percent). Sponges/soft corals, seaweed and hard corals were each cultivated by 12 percent of the aquaculture households in FSM.

Of the people who worked on the aquaculture farms, 77 percent of the main operators and 70 percent of those that usually worked were males. Aquaculture is not a full-time activity for most of these people and 69 percent of male workers and 66 percent of female workers worked less than ten hours in the week of interview.

7.1 Forestry and handicrafts

The forest is widely used across FSM for production, most frequently for firewood gathering and for wood for building forestry. Trees are also used for carving and handicrafts, and for making canoes

Social and cultural values were also important reasons for purposes for forests.

TABLE 7.1
Households using forest and main purpose by state: 2016

	FSM	YAP	CHUUK	POHNPEI	KOSRAE
Number of households using forest	9 208	1 400	4 522	2 977	309

Soil and water protection	6	8	8	3	7
Recreation and eco-tourism	1	1	1	0	0
Improving agriculture	4	4	4	4	2
Others	4	3	4	4	13

The main uses of trees or forest products reported varied across states, although firewood was most reported in all states. Gathering medicines was a minor use in most states, but Yap reported 12 percent of households using forest for this, compared to four percent of households in Chuuk, two percent of households in Pohnpei and one percent of households in Kosrae.

TABLE 7.2

Gathering wild food	2	2	3	1	1
Gathering medicines	4	12	4	2	1
Other use	1	1	1	1	0

Source: FSM 2016 Integrated Agriculture Census

The tree species reported to be used varied by state for different uses. In Yap,

- Calophyllum inophyllum was reported to be the most used species, for building or furniture and firewood.
- Breadfruit was also used for firewood and for making canoes.
- Coconut was used for handicrafts, and also for building or furniture.

In Chuuk,

- Breadfruit was reported to be the most used, for firewood and for making canoes.
- Mangrove was widely used for firewood, and also for building or furniture.
- Coconut was used for building or furniture, and also handicrafts.

In Pohnpei,

- Other species were reported to be most used for firewood, and also for building or furniture.
- Mangrove was also used for building or furniture and for firewood.
- Ivory nut tree was next most reported used, mainly for building and furniture.

In Kosrae, with the lowest reported level of use of forests, mangrove was the most used species, for firewood and for building or furniture.

Firewood was most frequently gathered, with over half of those using forests for firewood reporting 20 or more trips in the past year.

Across FSM, 29 percent of males and 13 percent of females aged 20 and over were reported to be involved in forestry activities.

Handicrafts were not widely carried out and although ten percent of all households reported using forest products for handicrafts, only four percent of the population aged 20 and over were reported to be involved in handicraft activities.

7.2 Hunting

Hunting was reported by 14 percent of households in FSM, but at higher rates in Yap (40 percent of households) and Chuuk (16 percent of households), where nearly all of the hunting households reported catching land /coconut crabs. The mean number of crabs reported caught by hunting households in the past year in Yap was 153, and in Chuuk 89, with a reported total of nearly 234 000 crabs caught over FSM. Most of this catch was for only home use (84 percent) or mainly for home use (14 percent) with a small proportion (1.4 percent) reported for sale.

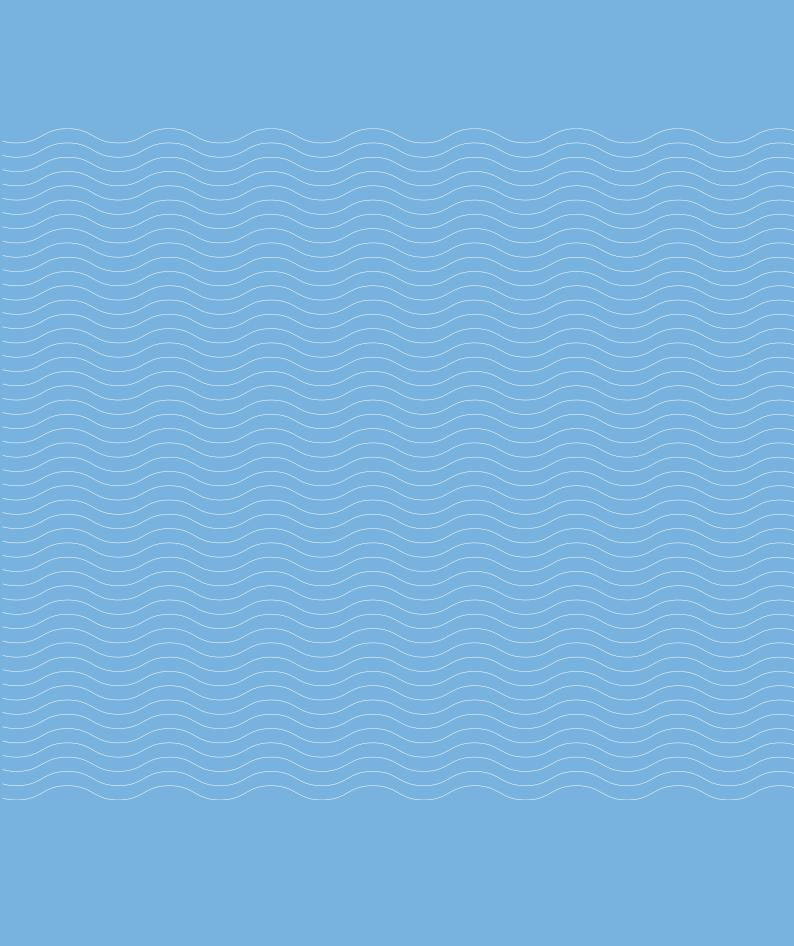

TABLE 7.3 Hunting by state: 2016

	TOTAL	YAP	СНИИК	POHNPEI	KOSRAE

Land/coconut crab	91	98	96	54	20
Other wild animal/bird	4	3	4	10	2

Source: FSM 2016 Integrated Agriculture Census

Hunting was reported by fewer households in Pohnpei (five percent) and Kosrae (four percent) and the purpose varied depending on what was caught. Wild pigeons were caught more for sale than for other purposes, and wild pig, fruit bat and deer were also more frequently caught for sale.

In Yap 44 percent of the people reported engaging in hunting activities were female, compared to 21 percent female in Chuuk, 19 percent female in Pohnpei and 24 percent female in Kosrae.

8.1 Equipment

In the 2016 Integrated Census of Agriculture households were asked about equipment used for fishing and farming.

Most households reported using the most basic tools. Machetes were reported used by 97 percent of households with land for agriculture, and shovels were reported by 91 percent. Nearly all of those using these tools owned their own tools.

The next most commonly used equipment were wheelbarrows, weed eaters (line trimmers) and chainsaws, but the rates of use of these tools varied across states. Wheelbarrows, weed eaters and chainsaws were reported to be borrowed by between 20 and 30 percent of users.

TABLE 8.1

Equipment used by state: 2016

	FSM	YAP	сниик	POHNPEI	KOSRAE

Cars	31	38	11	46	50
Trucks/Pickups	8	10	5	10	17

Source: FSM 2016 Integrated Agriculture Census

Farming equipment was analyzed to see if farms with access to larger areas of land or farms with a higher proportion of income from agriculture were more likely to have used a wider range of equipment, but no relationship was found.

Fishing equipment was reported used by 74 percent of the households that reported carrying out fishing activities. Fishing boats with outboard engines were reported used by 48 percent of fishing households, canoes by 37 percent and fishing boats with inboard engines by 16 percent of fishing households.

Cars were reported used by 31 percent of all households for agricultural or fishing activities, but only by 11 percent in Chuuk, where transport by boat between islands is common. Trucks and pickups were used by eight percent of households. Both cars and trucks/pickups were used by a higher proportion of households in Kosrae than in other households.

Solar panels were reported used by 21 percent of all households in Yap and 28 percent of all households in Chuuk, where there is less municipal electricity available. Around eight percent of the panels were reported to have been supplied by the Government.

8.2 Market access and services

The access to markets and services is an indicator of the strength of the agricultural infrastructure to support the farmers.

Under half (48 percent) of the households with land for agriculture reported engagement in markets for their produce. Thirty percent of farm households lived less than an hour from a market, but for 2.5 percent of households there was no market accessible or available.

Around nine percent of households with land for agriculture reported participating in product organizations in the past year. This was consistent across the states with participation by 10 percent of farm households in Yap, 8 percent in Chuuk, 9 percent in Pohnpei and 11 percent in Kosrae.

Agriculture extension services had visited 19 percent of households in the census year, half of them twice. Chuuk had the highest proportion of households reporting visits from an extension officer with 14 percent reporting one visit and 11 percent reporting two or more visits.

However, the main sources of information about agriculture were the radio (31 percent), other farmers (24 percent), or agriculture extension services (13 percent).

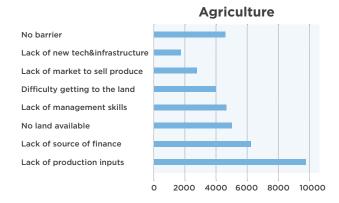

8.3 Barriers to further development

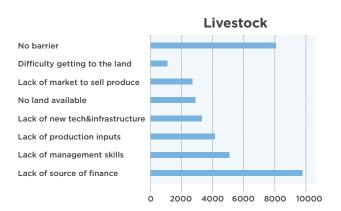

Reported barriers indicate where the farmers see a need for investment for development. The most commonly reported barriers to any further activity were:

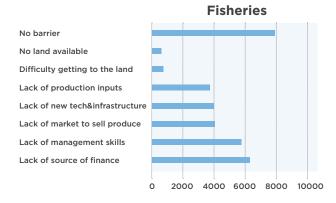

- Lack of production inputs (particularly for agriculture)
- Lack of source of finance
- Lack of management skills (particularly for handicrafts and livestock)
- Lack of market to sell produce
- Lack of new tech & infrastructure was a barrier particularly for fishing and livestock.

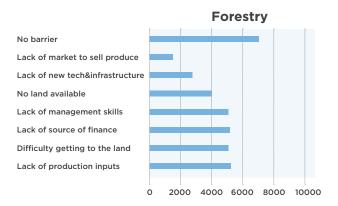

However, 30 percent of households reported no barriers to further agricultural activities, 52 percent of households reported no barriers to more livestock, 51 percent reported no barrier to more fishing, 45 percent reported no barrier to more forestry activities and 53 percent reported no barrier to more handicrafts.

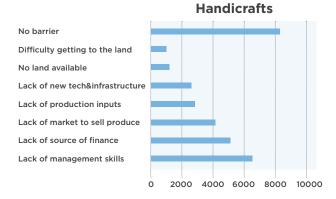

GRAPH 8.1Number of households with barriers to activities: 2016

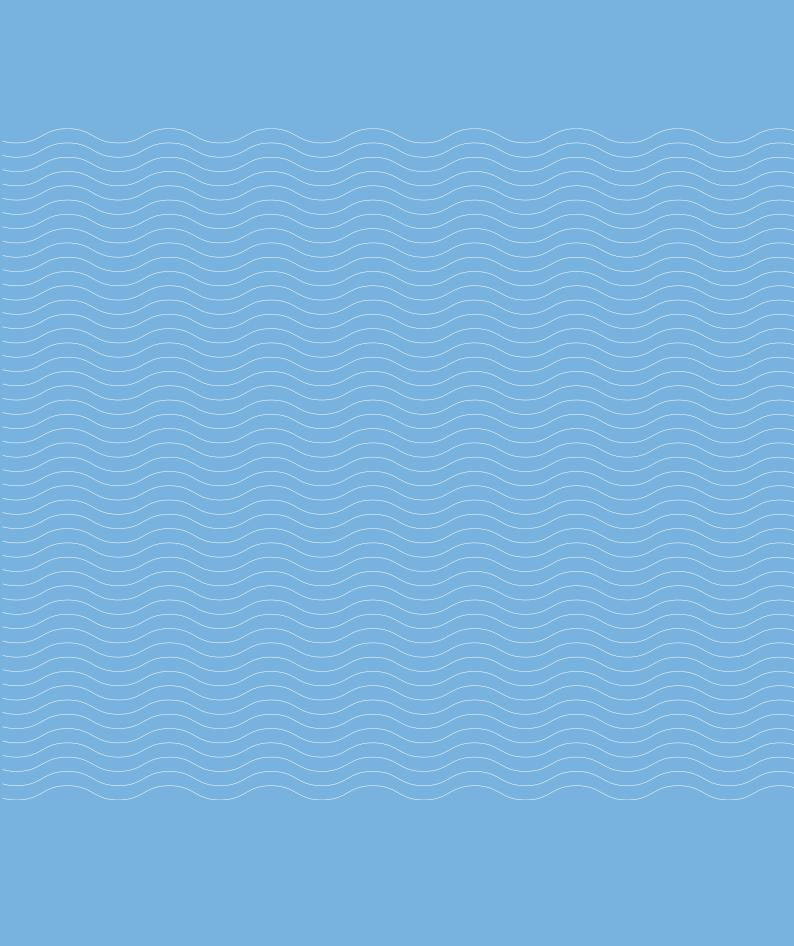

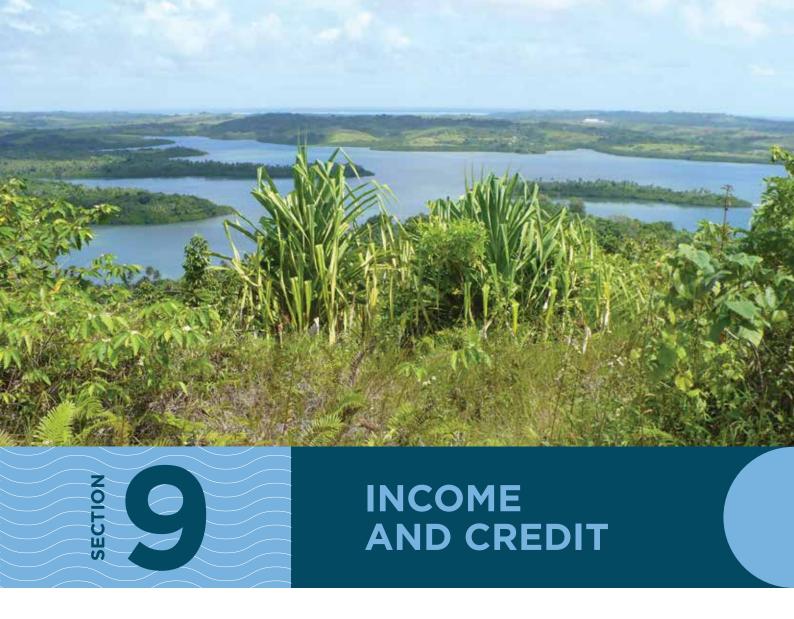

9.1 Income sources

The largest source of cash income for all households reporting in the 2016 IAC was paid work in a non-agricultural occupation, with 38 percent of households reporting that across FSM.

However, for 25 percent of households, the main source of cash income was agriculture or fishing. Mostly this came from their own business, with a small number in paid agricultural of fishing work.

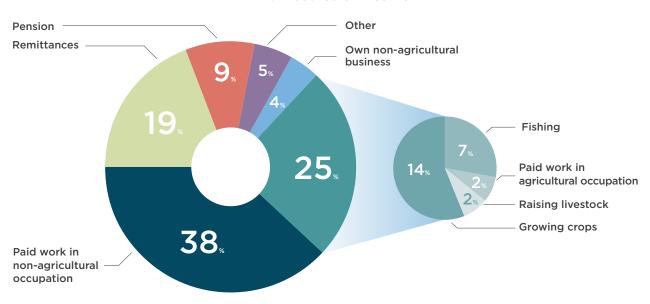

GRAPH 9.1

Main sources of cash income for all households: 2016

Main source of income

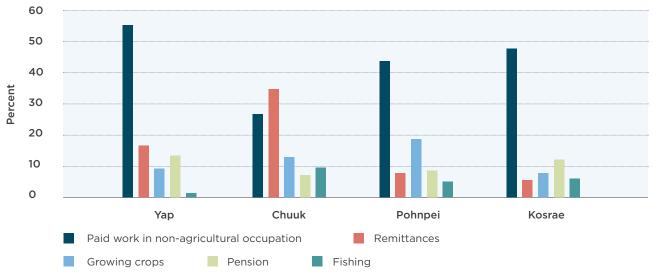

Source: FSM 2016 Integrated Agriculture Census

The top sources of cash income reported varied over the states. In Chuuk, paid work of any sort was less reported than remittances as the main source of cash income. Remittances were the second most reported main source of income in Pohnpei, and pensions being the second most important in Kosrae.

GRAPH 9.2

Main sources of cash income for households with land for agriculture by state: 2016

Growing crops provided the main source of cash income for 14 percent of households across FSM, with over 20 percent of farm households reporting this in Pohnpei.

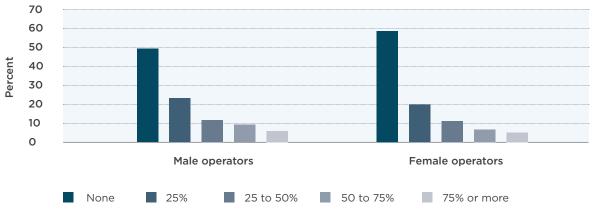

Fishing was reported as the main source of cash income for 7 percent of households. Despite over 60 percent of households in Yap undertaking fishing it was rarely the main source of cash income.

In Chuuk however, fishing was the main source of cash income for 10 percent of households.

9.2 Proportion of Income from agriculture

Across FSM, over 50 percent of households with land for agriculture reported that they received no income from agriculture. In Yap, nearly 70 percent reported no income from agriculture while in Pohnpei less than 40 percent reported receiving no income from agriculture.

GRAPH 9.3Proportion of income from agriculture by gender: 2016

Source: FSM 2016 Integrated Agriculture Census

Where the main operator was female, nearly 60 percent received no income from agriculture, compared to 48 percent of households where the main operator was male. In Yap, where the proportion of female operators was highest at 40 percent of operators, 75 percent of households with female operators received no income from agriculture, compared to 65 percent of households where the main operator was male. This suggests a high reliance on agriculture for subsistence, particularly for female operated farms, and less market opportunity in Yap.

The proportion of income from agriculture question asked for an assessment of cash and inkind income. There is some agreement between the numbers reporting that their main source of cash income was growing crops or livestock, and the number with more than 50 percent of their income from agriculture, suggesting that this question was usually interpreted as cash income, but the numbers for Chuuk suggest a problem with the data there.

TABLE 9.1

Main source of cash income and proportion of income from agriculture by state: 2016

	FSM	YAP	СНИИК	POHNPEI	KOSRAE
		Nu	mber of househo	olds	
Main source of cash income is growing crops or livestock	2 487	213	908	1 233	133
More than 50% of income from agriculture	1 954	190	499	1 115	110

9.3 Loans for development of agriculture, fishing or forestry

Households were asked if they had used any loans to develop their agriculture (crops or livestock), forestry or fishing activities in the past year. A total of 672 households, or 4 percent of all households reported using a loan, and 73 percent of these households had borrowed from a bank. The next most common source of finance was a private person, except in Yap where other loan agencies were used by 18 percent of borrowers.

Use of a loan or credit was most common in Kosrae, where 14 percent of households reported that they had borrowed, and least common in Yap where only 1.5 percent of households reported that they had borrowed.

APPENDIX 2 OTHER TABLES AVAILABLE UPON REQUEST

A large number of these tables are available by municipality as well as by state and can be requested from FSM Statistics. Some of the tables described here should be used with caution as they may not have been produced in the same way as the aggregate tables. For example, detailed tables for crops are available for the three plots of land reported on and aggregating across plots is not equivalent to households.

The following sets of tables were produced at the National and State levels:

1. Municipalities crossed by all of the other variables

For each State, the columns were the municipalities.

These tables include:

- 1. Population relationship, sex, age, derived age at marriage, schooling and educational attainment,
- 2. Economic activity and labor force participation, hours worked, occupation, industry, looking for work
- 3. Unshared Land information about unshared land in general, and for each of three parcels of unshared land
- 4. Shared land information about shared land in general, and for each of three parcels of shared land
- 5. Land issues specific issues related to the land associated with the specific household
- Crops Production information about the specific crops produced on each parcel, including detailed information about each type of crop, how much was being produced, and other information about specific crop production
- Crops Harvested information about the specific crops harvested on each parcel, including detailed information about each type of crop, how much was being harvested, and other information about specific crops harvested
- 8. Other crops information about other crops associated with the specific household
- 9. Livestock information about types of livestock, like cattle, pigs and chicken, how many were produced, how many were sold, how many were given away, young chicks, and other information about livestock
- 10. Fisheries information about the types of fish, the amounts taken, amounts sold, species, and other characteristics of fishing activities
- 11. Aquaculture information about aquaculture activities, including types of aquaculture, the amount of each species grown and/or collected, and other aspects of the aquaculture activities
- 12. Forestry information about forestry activities including amounts produced, types of products, amount sold, etc.
- 13. Equipment type of equipment for all the various activities described, including crops, livestock, fishing, aquaculture, forestry, and amounts and frequency used
- 14. Agriculture services agricultural services, barriers, and other characteristics

2. Additional tables

- 1. Numbers of households involved in cultivating each crop. The number cells are counts of numbers of households that grew the crop on any parcel of land, by state.
- 2. Number of households with new planting of each crop. The number cells are counts of numbers of households that had the new planting on any of the plot, by state.

- 3. Total pounds/ other units harvested of each crop. Quantity of harvest information in pounds only for those households that reported the crop in pounds, by state.
- 4. Number of Households harvesting each crop by municipalities. The cells in the column counted the households that have harvested the crop from any parcel, by state.
- 5. Number of households selling each crop. The cells counted the households that had sold the crop from any parcel, by state.
- 6. Number of agriculturally active households participating in producer organization, number of agriculturally active households by number of visits from an agriculture extension agent in the last 12 months, number of agriculturally active households by sources of information on agriculture, number of agriculturally active households by time taken to get to a place to sell products, by municipality.
- 7. Source of cash income, proportion of income, use loan/credit, source of loan by municipality and whether agriculturally active.
- 8. Number of agriculturally active households using chemicals, number using organic farming methods, number growing medicinal plants (table not currently available).
- 9. Crops by reason for crop loss (table for FSM and each state) The cell sum is the number of occurrences of each loss but no losses are only counted once for each crop/parcel, by state.
- 10. Number of agriculturally active households by total area of land (categorized) that they operate (sum of shared and not shared areas) by main purpose of use of land, by state.
- 11. Number of households by total area of land (categorized) that they have access to (sum of shared and not shared areas) by use of each equipment types, by state.
- 12. Number of households by use of each equipment types by proportion of income from agriculture, by state.
- 13. Number of agriculture active households by sex of main operator by the proportion of their total income generated from agriculture activity, by state.
- 14. Number of people 15 and over in the labor force by Occupation and main activity by sex and state.
- 15. Number of people 15 and over in the labor force by Industry and main activity by sex and state.

APPENDIX 3 METHODOLOGY AND QUALITY

This report outlines the processes of development and carrying out the Federated States of Micronesia Integrated Agriculture Census 2016 (IAC 2016). It provides some assessment of the impact of development and timing issues on the results of the census.

The 2012 Federated States of Micronesia Agriculture Policy document proposed that an agriculture census should be carried out. FSM then started planning work for the National Agriculture Census, initially planning the project for 2013 (see Capital Investment Project Department of Resources and Development FY13)

Full funding was not achieved for this timeframe and FAO included support for a census (to be carried out by end 2015) in their FSM Country Programming Framework (CPF) Implementation and Monitoring Plan 2013-2015. The Secretariat of the Pacific Community (SPC) was expected to contribute support, and further support was found from the Government of India.

The Census was eventually carried out in 2016. This report documents the processes from initial development to analysis. It draws on the work of Michael Levin who assisted with the data processing system, edited the dataset and produced tabulations. He also carried out a detailed demographic analysis of the data.

Methodology

Preliminary consultation and planning

FSM held an Agriculture Census - Planning and Preparation Workshop on December 5, 2014. A follow-up workshop was held in February 2015, with participation from FSM State statistics, agriculture and fisheries departments as well as a range of stake holders. At this, the FAO guidelines for agricultural censuses were introduced and priority topics identified. Part of the aim of the workshop was to ensure that the important partners were clear on the objectives of an agriculture census and their role in the process. FAO supported the attendance of representatives from the FSM states at this workshop.

Methodology design

The general approach to the design of the census was based on the Food and Agriculture Organization of the United Nations, 2017, *World Programme for the Census of Agriculture 2020.* This was available in draft form at the time of the Census development. However, as FSM have more knowledge and experience of conducting household income and expenditure surveys and population censuses, much of the format and planning followed those models. Enumeration areas (EAs) were based on the areas defined from the 2010 methodology, as used in the 2013 Household Income and Expenditure Survey (sample survey). Enumerators were asked to update the listings as they went.

There are very few commercial farms in FSM and all were able to be identified through the household survey frame. Other institutional farms (e.g. church, community or school farms) were not known, and enumerators were asked to identify them on a separate listing for future research.

Scope and coverage

The intended scope of the census was information on the agricultural production industry, and this was interpreted very broadly. The IAC included crop and livestock production activities, forestry and fisheries activities, other food- and agriculture-related activities, and other relevant information.

The data was collected in eight sections:

Section I: Demographic Profile and Labor Force Status

Section 2: Land Section 3: Crops Section 4: Livestock

Section 5: Fisheries and Aquaculture

Section 6: Forestry, Hunting and Handicraft

Section 7: Equipment

Section 8: Services, Barriers, Food Insecurity, Income and Credit

Ideally, an agricultural census should cover all agricultural activity across the whole country. The census for FSM was intended to cover all agricultural activity carried out by households. Almost all households in FSM have some own-account agricultural production activities, such as keeping a few chickens or having a small kitchen garden. The inclusion of small holdings was considered essential to ensure all food production is covered, and to reflect women's participation in agricultural work.

The operation of the census was carried out using the FSM Statistics Division's usual processes for pen and paper surveys. Computer-assisted personal interviewing (CAPI) was not considered for the IAC because there was no previous experience in FSM with CAPI.

Questionnaire design

Based on the topics identified in the consultation process a draft outline was developed and this was converted to a paper questionnaire. The questionnaire layout was developed using the 2013 Household Income and Expenditure Survey as a model. This meant that the development was less difficult for the Statistics Division team, but the structure was not well set out for agriculture collection when multiple plots of land were farmed. The design meant that detailed data was collected for a maximum of three individually owned plots and three shared plots.

The questionnaire was not translated into any of the many local languages.

Pilot testing and train the trainers

The SPC Technical Adviser and the FAO Consultant both contributed to the first training of trainers training for the Pilot test in January 2016.

The training focused on the concepts and definitions for the survey and included training in area estimation.

However, there was no opportunity for the consultants to review the questionnaire after the pilot test. There were many areas that could have been simplified or improved but few changes were made after the pilot test.

A second training of trainers was held in May 2016, focusing on operational matters. Neither consultant was able to attend.

Enumerator and supervisor recruitment and training

The recruitment for enumerators and supervisors was carried out using FSM standard practices for statistical surveys and the recruits included people had worked on previous Household Income and Expenditure Surveys (HIES) or population censuses. However, there was no one with previous experience of agriculture statistics collection in FSM. Although the agriculture and fisheries staff in the states assisted with the training and recruitment, they had little knowledge of the statistical requirements and formal definitions and concepts. So it is not surprising that quality of the enumeration varied.

Training was carried out in the four states in June 2016, with five days training for both supervisors and enumerators followed by an additional three days of training supervisors. The training was split into several groups in the larger states, meaning the trainers were spread very thinly. Where possible, the groups were organized around the area the enumerators would be collecting in, and each area was allocated trainers who spoke the appropriate language. A representative of the state agriculture and fishing departments was also nominated for each training session, but were not always available when needed.

This training time was only just enough to go through all the content, and there was insufficient time to do specialized training and practice in estimating area or ensuring all the agricultural concepts were well understood. Training was carried out separately in each state, and the there was little overlap of the trainers. Although all trainers had undertaken the training of trainers courses, there are variations in results between states that suggest there may have been differences in interpreting the questions. For example, the questionnaire was intended to collect information on dogs, but not other household pets, and this was covered in some training sessions. However in one state a number of cats were recorded as livestock.

The SPC Technical Adviser supported the training in Pohnpei and the FAO Consultant supported the training in Chuuk.

The number of staff expected to be recruited is given in the following table.

TABLE 59
Estimated number of households, and staff required for IAC 2016

STATE	NUMBER OF OCCUPIED HOUSEHOLDS	NUMBER OF EAS (REVISED)	NUMBER OF ENUMERATORS	NUMBER OF SUPERVISORS	TOTAL FIELDWORKERS
Total	16 767	570	570	140	710

Pohnpei	6 289	205	205	46	251
Proper	5 970	196	196	44	240
Outer Islands	319	9	9	2	11
Kosrae	1 143	40	40	9	49

Enumeration

Enumerators and supervisors were deployed in the field from June 30, 2016.

The census was supposed to be carried out over July 2016. However delays and difficulties in organizing transport meant that some outer islands were not completed until about six months later.

The number of houses identified/approached, and their final status is given in the following table. As can be seen the total number identified is higher than the original 16 767 occupied houses used to estimate the number of enumerators, but with the number of vacant and demolished houses identified, the final number of interviews completed or partially completed was substantially lower.

TABLE 60
Final enumeration status

HOUSEHOLD OCCUPANCY STATUS						
STATUS CODE ¹	YAP	СНИИК	POHNPEI	KOSRAE	?	GRAND TOTAL

Total	3 088	6 454	6 879	1 168	1	17 590
Codes 1 and 4	2 279	5 667	6 006	1 037	0	14 989
Number in provisional tables	2 279	6 223	6 006	1 037		15 545

Note code 2 is 'No household members home at time of visit'. All households with this code were revisited and allocated another code.

¹ All households with initial status code '2 No household member at home at time of visit' were either interviewed or reclassified before the questionnaire was submitted

Data processing

Delays and funding difficulties meant that developing the systems, the data entry and database structure, editing, tabulation and analysis were all carried out by different people at different times.

Data entry was delayed due to issues both with developing the data entry system and funding for data entry staff. The data entry system was partly developed by SPC and partly by FSM staff.

The data entry system was developed in CSPro with the dictionary including 14 record types based on the questionnaire format. The dictionary record types included population, auxiliary variables, unshared lands used, shared lands used, other lands used, crops produced, crops harvested, other crops, livestock, fishing, aquaculture, forestry (and others like hunting, handicrafts), equipment, and agriculture services. While these 14 record types make entry easier, they become bulkier for editing, and even more complicated for making tables across record types.

Data entry was delayed due to resourcing issues and an initial 10 percent of the data was entered in 2017 in the different states, to test the entry application and estimate the entry duration. The data was re-entered after the data entry system was refined and data entry was all completed in 2018.

A full set of tables by municipality was developed based around the questionnaire content. For the main report additional analytical tables were produced, but due to the delays and difficulties working with the data not all derivations needed were able to be produced, and by the time the analysis was done much information needed about the data and tables was not available.

Editing, imputation and weighting

After the data was entered, incomplete households were edited, and values imputed for missing key variables. As this was two years after the enumeration, it was too late to return to the field for any additional data collection.

Chuuk presented a problem. Some Enumeration Districts (EDs), particularly on Weno, were not included in the census. For these EDs, the information in adjacent EDs was copied and pasted into its proper place in the geographic hierarchy with the ED geography changed to reflect what should have been there. So, it is possible that this procedure skewed the data somewhat, but it was felt that since most of Weno – which is urban – did not do much agriculture, this would be acceptable.

One of the Hall Islands was also not enumerated. The information from an adjacent island was duplicated and dropped into the proper geographic sequence, and the ED numbers changed so that an estimate of the population and characteristics for that island could be included in the census results. Most of the outer islands have similar agriculture and fishing patterns, so it was deemed acceptable to do this.

However, the total for Chuuk came out very low, much lower than would have been expected given the current migration patterns. A weight (adding 10 percent) was assigned to the Chuuk records, but the numbers are still low. There was also evidence that the Pohnpei total counts were low, but those for Yap and Kosrae were in line with what was expected.

Under coverage adjustment

After the census, a follow up Chuuk household listing was carried out using tablets to understand what areas were missed. At the time of writing this had not been analyzed, but as noted, data from Chuuk was weighted up by ten percent in the tables.

Tabulation

A preliminary set of tables were proposed before the census was finalized. However they were not evaluated or tested, nor used to guide the database construction. Some of these tables proved difficult to program with the complex data structure.

After the data entry was set up another set of tables was developed but these were designed more from a demographic perspective and there were a number of gaps in items important to agriculture.

Analysis

By the time the analysis was carried out much of the knowledge about the data structure and derivations were not available.

Quality assessment

Tabulation, and hence reviews of the data outputs, were only carried out at a very late stage, so correction of problems found was very difficult. The main issues include demographic profile, land area, crop data, livestock and fishing.

Demographic profile

Number of households and total population are low compared to previous data gathering. The possible sources of the differences were analyzed by Michael Levin and are likely to be a result of both out-migration and under-coverage, but no obvious demographic biases were noted.

Land area

The collection of area data is affected in several ways. People often do not know or have information to estimate land areas, land can be shared among a number of households and operated jointly, boundaries are unclear and in some places there are limited official records and land ownership may be disputed.

Two variables were used in the tables: UNACRES (acres of owned, not shared land) and SACRES (acres of shared land). However, no one seems to know how these variables were created, or if they correctly converted the land area recorded in hectares into acres and included these in the total.

Estimates of the total land area used for agriculture were derived from a table that categorized the total area of a household's land used for agriculture (sum of the SACRES and UNACRES variables), using the midpoints of the category ranges below. Despite the issues with the data, this produced result comparable with other sources of information as shown in the main report Land section.

TABLE 61
Estimates for land area calculations: 2016

CATEGORY	MIDPOINT USED IN CALCULATIONS.
Less than 0.2 acres	0.15
0.20 to 0.49	0.35
0.50 to 0.99	0.75
1.00 to 2.49	1.75
2.50 to 4.99	3.75
5.00 to 9.99	7.50
10.00 to 14.99	14.00
15.00 to 19.99	18.00
20.00 to 29.99	25.00
30.00 to 39.99	35.00
40.00 to 49.99	45.00
50.00 to 99.99	75.00
100.00 acres or more	110.00

Crop data

Crops data was fairly consistent with what was known about FSM agriculture and no significant issues were identified with the reported number of households growing crops. However, the quantity harvested was recorded in a range of units and further analytical work is needed to be able to use the data to be able to estimate total production volume and values.

One inconsistency was noted in that 74 percent of the households reported that the main purpose of land use was for home consumption only (no sales), but for major crops sales were reported by over 40 percent of households. This may be a matter of interpretation of 'main purpose'.

Livestock

Total numbers of livestock look reasonable, in comparison with the 2013 HIES:

TABLE 62
Total livestock by survey: 2016

	PIGS (AND PIGLETS)	CHICKENS	DOGS
2013 HIES	25 000	77 900	14 000
2016 IAC	29 916	70 828	16 636

Pigs and piglets were asked separately in the IAC, while the HIES only asked pigs, and piglets may not always have been counted.

However, both the number disposed of in the past year and the number of births look unreliable. For example, there were around 10 000 adult female pigs recorded. Even if only half of these gave birth to an average of 5 pigs, we would expect around 25 000 births as opposed to the 5 000 recorded.

The total value of sales, \$902 702, looks a bit low compared to that recorded in the 2013 HIES (\$1173 000), and the numbers sold are hard to validate. The average value per animal sold were discussed with the local staff and seem odd for pigs (too low), chickens, (too high) and dogs (too high).

There is also evidence that the livestock services question was not well understood. For example, castration or artificial insemination being reported for chicks (that are unsexed) or the level of animal waste disposal to septic tanks.

Fishing

Households were asked how many fishing trips they made for each method of fishing, and also how many fishing trips they made for each area/habitat they fished in. Where a trip covered more than one method of fishing or more than one area the trips would be reported in each category. They were also asked to report the number of trips either monthly or weekly. To obtain estimates of the number of trips per month, the weekly data was multiplied by four. This was then categorized, and only the numbers in each category were supplied to the analyst. Mid-points were chosen to calculate the totals and averages:

After the data entry was set up another set of tables was developed but these were designed more from a demographic perspective and there were a number of gaps in items important to agriculture. of the category ranges below. Despite the issues with the data, this produced result comparable with other sources of information as shown in the main report Land section.

TABLE 63
Estimates for fishing trips per household per month: 2016

CATEGORY	VALUE USED TO CALCULATE TOTAL AND AVERAGES				
1 to 7 per month	4				
8 to 14 per month	10				
15 to 21 per month	18				
22 to 30 per month	27				
31+ per month	31				

A statistical validation of the Food Insecurity Experience Scale Module is presented in the Annex to this section.

Recommendations for future

Analysis of the 2016 Census

There is a lot of data in the FSM 2016 that has not been fully analyzed, and further work would significantly enhance usability and usefulness of the information.

With the data in its current format it is difficult to access and analyze. It is recommended that the data be made available to the SPC to be archived in the Pacific Data Hub. At that point it would be helpful if the data was reconfigured to allow for additional analysis now, and for easier trends analysis when the next agriculture census is undertaken. This could also allow in-depth analysis to be carried out by researchers for approved projects.

Most of the value of production has not been able to be estimated for the initial report. The exercise to convert the crop data to standard units and then estimate its value would be very useful. Some elements of the 2013 HIES data and methodology may be able to be used to validate the value of crops, livestock and fishing production.

Assuming there is little double counting of plants in shared parcels, plant numbers can be used to estimate the single crop equivalent area using conversion tables. Single crop equivalence conversion tables are available for some Pacific countries and FSM agriculture staff may be able to develop them for FSM based on plant spacing guidelines.

Recommendations for future agriculture statistics

FSM does not have the resources for regular annual agriculture data collection. It is intended to expand the range by collection of basic information in the population census and other surveys.

An agriculture survey is proposed for 2021. This could focus on more accurate collection of production or yield data to improve production estimates required for Gross Domestic Product estimates.

Further information/data collection will also be needed to establish more accurately the area of land held and the crop uses.

Questionnaire improvements

The following are some suggestions for improvement if a similar census/survey is carried out in future. The whole questionnaire should be simplified and reduced to make data collection, processing and analysis simpler

Section 1 Demographic profile and labor force status.

This section could be significantly reduced as much of the information is not essential for an agriculture census.

- Section 1.1 Simplify education questions to avoid inconsistencies between highest grade completed and currently attending.
- Section 1.2 'Available for more hours' and 'Looking for work' questions were not used and could be dropped. Industry and occupation could be replaced by questions focusing on Agricultural activity, replacing the 'Which members of this household are normally engaged in...' questions in sections 3, 4, 5 and 6.

Instead of these questions, the questions on involvement in agricultural activities could be included in this section, simplifying later sections of the questionnaire.

Section 2 Land

The tabulation and analysis of this section was very complex and key variables such as total area were only able to be estimated, and not verified. It would be best if the land area could be more accurately measured and its uses better allocated. Investigation of the potential for satellite data to supplement data collection could be useful, although the amount of informal agro-forestry means that boundaries of land use or crop identification is likely to be difficult.

For shared parcels, a better way of allocating the individual production to land area is needed. A separate holding and parcel questionnaire approach should be tested. If CAPI is able to be used this would be a more efficient way of collecting parcel data.

Section 3 Crops

Crop production estimates are vital. Although censuses are not usually the primary source of production information the lack of other data in FSM means that the census is a core source. Further analysis of the 2016 data should help to identify the best indicators of production and enable the detail of crop information to be reduced.

Section 4 Livestock

The question on livestock services and waste disposal was not well understood and need to be improved.

Section 5 Fishing

Simplify the questionnaire by asking number of fishing trips only once, not against each species/habitat.

Section 6 Forestry, Handicraft & Hunting

For forestry, the question 'Parcels harvested from' was not used. Questions to better identify environmental issues with forestry use may be more valuable.

Section 7 Equipment

These questions are standard.

Section 8 - Services, Barriers, Income and Credit

The Food Insecurity Experience Scale questions may not be needed in an agriculture census if other sources of the data are available.

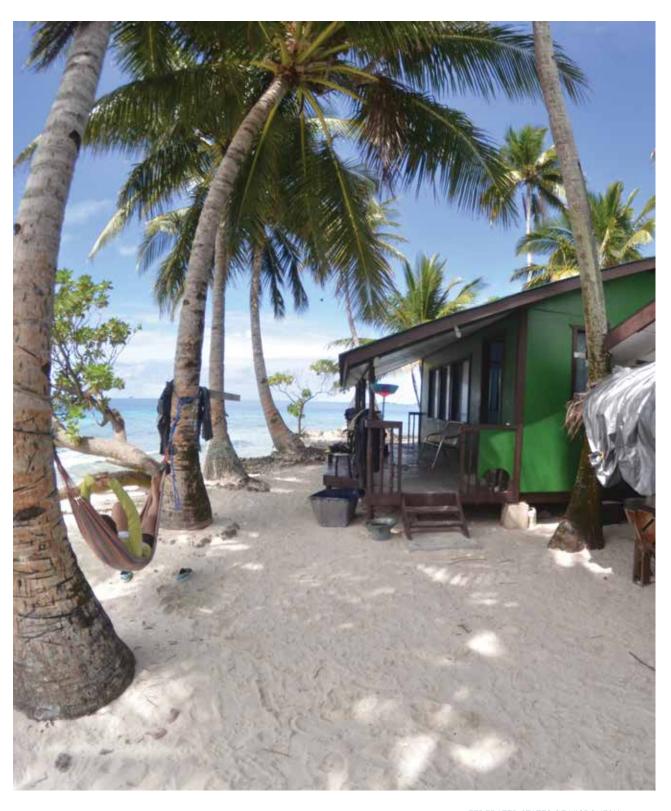

Methodology

If CAPI is proved successful in the 2020 Household Income and Expenditure Survey, a CAPI methodology could be adopted for FSM agriculture surveys and censuses, potentially based on models being used in other Pacific countries.

Classifications and definitions

The definitions were almost entirely based on the FAO guidelines from FAO World Programme for the Census of Agriculture (WCA) 2020, as the limited experience with agriculture data collection meant that there was little knowledge available about modifications that might make them more appropriate of understandable for the FSM context

The definitions used are available in the Questionnaire, Map, & Household Listing Instruction Manual which will be available on the FAO website http://www.fao.org/world-census-agriculture/wcarounds/wca2020/countries2020/en/ as well as from the FSM Statistical office.

Annex 1: Statistical Validation of the FIES Module

The version of the Food Insecurity Experience Scale (FIES) was household level. The module was located after the module on services, barriers, income and credit.

Reference Period: 12 months

Background about survey implementation

The FIES was introduced in the national agriculture census. This is a test case, as it was the first use of the questions in the Pacific region. The manual and questionnaire were only available in English and enumerators were given instructions to translate when needed. Regarding refusal to answer, enumerators were given instructions not to push but try to provide comments on reasons of the refusal. This information was not available in the file. Instructions related to the FIES are quoted below:

3.8.3 Food Insecurity

This is an international standard set of questions to identify the extent that food insecurity is a problem for FSM. It is included here to provide information to understand links between food insecurity and agriculture and related issues and activities.

These questions are used to derive a Food insecurity scale. It can be a very sensitive issue for people so care will be needed. But with FSM experience of cyclones and drought it is likely that some households are struggling to eat well, and the data will be very helpful to better target help in future. Please ask questions 83101 - 83108 as close as possible to the wording give. If needed explain that there is no shame in reporting their experience, and there is very strong protection of confidentiality. Do not discuss these answers with anyone, or react to the respondent's answer.

Total sample seems to be of 15 545 agriculture households involved in farming but FIES data were provided for only 14 937 households. No information is available on why these households are missing. It is also unclear whether or not they were deleted because FIES was not administered to them or because they refused or did not know how to answer. In later cases, no final judgment on the performance of the scale can be formed even though the FIES passed all the statistical validity tests.

Results

The results of the analysis are then based on the 14 937 cases present in the available file. The number of non-extreme cases (cases for which raw score is different from 0 or 8) represents 6 924 households.

Overall reliability is high, with a Rasch reliability index of 0.73. The infit statistics of each items are within acceptable range (from 0.7 to 1.3), showing each item has the same ability to discriminate compared to the other items. The outfit statistics do not seem to show an issue in respondent pattern. All the other correlations that exist among residuals are lower than 0.4 which shows that all items measure only one latent trait, the food insecurity (see matrix of correlation) which is further confirmed by the scree plot of the matrix of residuals.

The analysis of the distribution or raw score shows that 35 percent of households denied all items and 19 percent affirmed all the items.

TABLE 64
Item parameters and fit statistics: 2016

ITEM	SEVERITY OF ITEM	STANDARD ERROR OF SEVERITY	INFIT	OUTFIT	PROPORTION OF AFFIRMATIVE RESPONSES (WEIGHTED)	NUMBER OF AFFIRMATIVE RESPONSES
WORRIED	-1.95	0.04	1.24	1.82	80.75	5 591
HEALTHY	-1.31	0.03	1.13	1.75	70.73	4 897
FEWFOOD	-1.30	0.03	0.87	0.91	70.67	4 893
SKIPPED	0.03	0.03	0.84	0.79	47.26	3 272
ATELESS	0.12	0.03	0.79	0.70	45.71	3 165
RUNNOUT	0.98	0.03	0.97	0.96	31.21	2 161
HUNGRY	1.17	0.03	0.86	0.78	28.39	1 966
WHLDAY	2.26	0.04	1.14	1.55	13.39	927

Equating to the global standard

Given the results of the statistical validation, the raw score can be considered a reliable, ordinal indicator of food security severity. The results reveal that, after appropriate scaling of the severity values, all the eight items can be considered "common" to the global FIES one. Figure 1 shows the equated common items.

GRAPH A.1

Equated items severities and identification of common items

As weights were not available we only estimated the prevalence for the sampled agriculture households and 45 percent of sampled households are "moderate and severe food insecure" and 18 percent are "severe food insecure". This later rate is close to the proportion of households that affirmed yes to all the eight items.

Conclusion

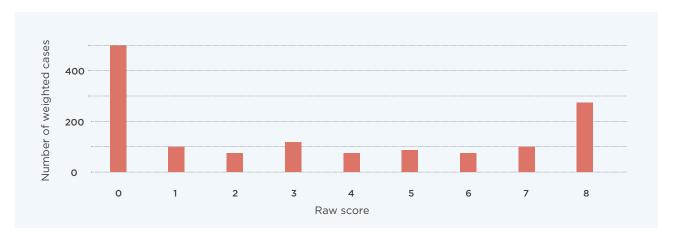

The results of the statistical tests tend to point towards a relatively good performance of the scale in FSM. However, because of the lack of information on missing households and non-response these results cannot be validated.

Additional Information

Distribution of raw score

The distribution of raw scores shows that 35 percent of households are food secure (raw score equals 0).

GRAPH A.2Distribution of raw score

Matrix of residual correlations

All correlations are lower than 0.3 (except correlation between ATELESS and SKIPPED that is a bit higher and equal to 0.35).

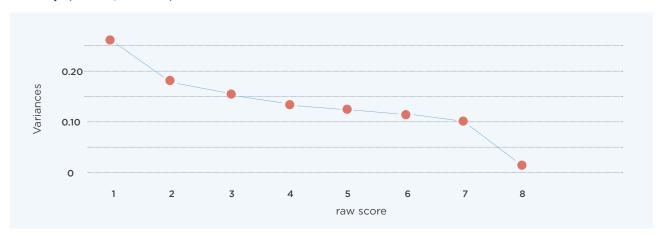

TABLE 65
Matrix of residual correlations: 2016

	HEALTHY	FEWFOOD	SKIPPED	ATELESS	RANOUT	HUNGRY	WHLDAY
WORRIED	0.025	0.010	-0.146	-0.097	-0.155	-0.136	-0.205
HEALTHY		0.201	-0.105	-0.079	-0.200	-0.203	-0.229
FEWFOOD			0.106	0.128	-0.069	-0.038	-0.172
SKIPPED				0.346	0.059	0.124	-0.020
ATELESS					0.134	0.138	-0.057
RUNNOUT						0.226	0.052
HUNGRY							0.211

Scree plot

The result of unidimensionality is further confirmed by the scree plot of the residuals showing the variance explained by each item. That there is no elbow in the contribution of each component to the total variance of the residuals means that each item contributes to the latent trait and no sub-dimension is observed.

S1.1 - Demographic profile (All persons)

10000) Please list all persons who usually live in this household (Usual Resident). Start with the head of the household.

Head of the household is the person in charge of the household finances/resources.

Only include persons who:

- a) currently live in this household (even if temporarily away, and they intend to return)
- b) absent more than a month but dependent on household (eg, student o'seas and in dorm only, person in hospital, etc)
- c) absent for more than a month, but part of (and supporting) the household (eg, seamen, seasonal worker, etc)
- d) visitors currently living with the household for more than 6 month
- e) just moved in with the household but intends to stay longer than 6 months

BEFORE YOU LEAVE THIS HOUSEHOLD,

BE SURE YOU HAVE RECORDED ON THE QUESTIONNAIRE COVER -

- 1. The geographic identification information State, EA No., Mapspot No., and Hhold No.
- 2. The name of the Household Head and the phone number (if any).

Also, be sure you have -

- 3. Completed as many of the census questions as possible.
- 4. Entered the required information on the Household Listing Guide sheets
- 5. Update the EA Map, as needed.
- 6. Written ALL entries clearly and legibly.

Also, upon completing the FINAL visit,

- 7. Verify and complete any pending information.
- 8. Complete information for FINAL section Month, Day, Enum. code, Status, and Total no. of visits.
- 9. Complete the PERSONS IN HOUSEHOLDS and MAIN [HM] RESPONDING TO HH QUESTIONNAIRE
- 10. Enter your signature with date in the certification section.

THANK THE RESPONDENT FOR HIS/HER COOPERATION
