Data source

Census of Population and Housing, Demographic Health Surveys, Vital Statistics Reports, Model Lifetables.

Data processing

The historic population estimates are interpolated from Pacific Island Countries and territory census population counts.

The projected population estimates are calculated by SPC using the most recent census population by age and sex, and assumptions on future age-specific fertility rates, probabilities of dying and net migration levels for the projection period.

Single age projections by sex are aggregated to 5-years age groups.

Some derived indicators are added : Proportions, variation rates.

Temporal coverage

First period 1950

Last period 2050

Data revision

The projections are rebased and revised on a regular three to four year cycle.
